Greenville County
Emergency Medical Services

Clinical Operating Guidelines

Tim Gault, Director
Martin Lutz, MD, Medical Director
Brandon Dawson, MD, Assistant Medical Director

Current as of October 2018– Version 1.3
This document describes the methods by which the Greenville County EMS system will continue to provide exceptional pre-hospital care. Evidenced – based guidelines, proven practices, and years of experience have been incorporated into this document to provide a solid foundation for the treatment of the vast majority of patients encountered. Medical Control can be contacted for those patients who do not fall into a stated protocol or if deviation from the stated protocol is required to best treat the patient. Providers must utilize good clinical judgment when interpreting these protocols and always act in the best interest of the patient. While appropriate and clinically sound care is imperative, it must also be delivered compassionately and empathetically.

**DHEC Licensed Rapid Responder Agencies in Greenville County who utilize Dr. Marty Lutz for Medical Control Physician are authorized to use these Clinical Guidelines.**

Only GCEMS, Clear Springs Fire Department, South Greenville Fire Department, Glassy Mountain Fire Department and Mauldin Fire Department are authorized to operate at the AEMT and Paramedic level. All other services may not exceed the Intermediate level at any time, even if Paramedics and AEMTs are employed.

**Patient Definition:** A patient is defined as any person who meets any of the following criteria:
- Receives basic or advanced medical/trauma treatment
- Is physically examined
- Has visible signs of injury or illness or has a medical complaint
- Requires EMS assistance to change locations and/or position
- Identified by anyone as a possible patient because of some known, or reasonably suspected illness or injury
- Has a personal medical device evaluated or manipulated by EMS
- Requests EMS assistance with the administration of personal medications or treatments
**Pediatric Guidelines:** The protocols are divided into Adult and Pediatric sections, as well as cardiovascular, general medical, trauma, and other special groupings. For pediatric patients, the appropriate pediatric-specific protocol should be utilized if one exists. If there is not a pediatric-specific protocol for a given pediatric patient situation, utilize the adult protocol, but always use pediatric weight-based dosing for medications. Never exceed adult doses of medication for a pediatric patient.

**Waivers:** Patients who are mentally capable of making decisions are able to refuse medical care, even if the consequences of the refusal of care may be potentially harmful or even deadly. The EMS employee shall ensure that the patient understands the contents of the waiver and is aware of the potential consequences of refusing medical treatment or transport. If at all possible, the patient should be advised of said consequences in front of a witness. Any non-emancipated minor who is between their sixteenth and eighteenth birthday may consent to health services, but may not refuse. A minor who is married, pregnant (or has been pregnant), or independently living away from home may refuse treatment and/or transport. Refusals of care and/or transport should be well documented in the patient care report (PCR).

**Health Care Power of Attorneys:** Patients who have a Health Care Power of Attorney retain the right to make healthcare decisions as long as they are mentally capable of doing so. No treatment can be provided or withdrawn against the patient’s will unless they become mentally incapable of making decisions.

**Surgical Airways:** While surgical airways are an approved South Carolina Paramedic level skill, at no time shall a Paramedic attempt a surgical airway, even with on-line medical direction, with the exception of those specifically appointed to perform the skill by the Medical Director.
# General 4.0

4.1 Universal Patient Care

# Airway Protocols 5.0

5.1 Universal Airway Protocol
5.2 Medication Facilitated Intubation (MFI)
5.3 Rapid Sequence Induction (RSI)
5.4 Post-Airway Management

# Adult Cardiac Protocols 6.0

6.1 Acute Coronary Syndrome
6.2 Bradycardia
6.3 CHF/Pulmonary Edema
6.4 Narrow Complex Tachycardia (Adult) QRS (<0.12)
6.5 Sustained Ventricular Tachycardia (Adult) QRS (>0.12)

# Adult Cardiac Arrest Protocols 7.0

7.1 Medical Cardiac Arrest
7.2 Cardiopulmonary Resuscitation Team-Based Approach
7.3 Deceased Persons
7.4 Post Resuscitation

# Medical Protocols 8.0

8.1 Abdominal Pain
8.2 Altered Mental Status/Diabetic Emergencies (Adult)
8.3 Anaphylactic Shock/Allergic or Dystonic Reaction (Adult)
8.4 Behavioral Emergencies/Chemical Restraint
8.5 Eclampsia/Pre-Eclampsia
8.6 Hypertensive Crisis/Urgency
8.7 Hypothermia
8.8 Medical Hypotension (Adult)
8.9 Nausea/Vomiting/Diarrhea
8.10 Obstetrical Emergency
8.11 Pain Management
8.12 Poisoning/Overdose (Adult)
8.13 Opioid Overdose (First Responder Only)
8.14 Reactive Airway Disease (Adult)
8.15 Sedation/Anxiety
8.16 Seizure (Adult)
8.17 Sepsis
8.18 Stroke/CVA/TIA

### Pediatric Protocols 9.0

- 9.1 Pediatric Medical Cardiac Arrest
- 9.2 Pediatric Bradycardia
- 9.3 Pediatric Termination of Ventricular Rhythms
- 9.4 Pediatric Unstable Tachycardia
- 9.5 Pediatric Altered Mental Status/Diabetic Emergencies
- 9.6 Pediatric Anaphylactic Shock/Allergic or Dystonic Reaction
- 9.7 Pediatric Fever/Infection Control
- 9.8 Pediatric Medical Hypotension
- 9.9 Newly Born
- 9.10 Pediatric Pain Management
- 9.11 Pediatric Poisoning/Overdose
- 9.12 Pediatric Reactive Airway Disease
- 9.13 Pediatric Seizure

### Trauma Protocols 10.0

- 10.1 Bites and Envenomation
- 10.2 Burns: Thermal/Radiation
- 10.3 Chest and Abdominal Trauma
- 10.4 Crush Injuries
- 10.5 Drowning and Submersion Injuries
- 10.6 Extremity Trauma/Amputation
- 10.7 Eye Injuries/Complaints
- 10.8 Head/Face Trauma
- 10.9 Heat Related Injuries
- 10.10 Hypovolemic Shock
- 10.11 Selective Spinal Immobilization
- 10.12 Traumatic Cardiac Arrest (Adult)
- 10.13 Traumatic Cardiac Arrest (Pediatric)
- 10.14 WMD – Nerve Agents

### Special Response Protocols 11.0

- 11.1 Jump START Triage
- 11.2 START Triage
- 11.3 Incident Command
- 11.4 Patient Flow Diagram During Incident Command
## Appendices

Indicates the lowest level certification that can perform this task.
Policy:

- Air transport should be utilized whenever patient care can be improved by decreasing transport time or by giving advanced care not available from ground EMS services, but available from air medical transport services (i.e., blood).

Purpose:

- Improve patient care in the prehospital setting.
- Allow for expedient transport in serious, mass casualty settings.
- Provide life-saving treatment such as blood transfusion.
- Provide more timely access to interventional care in acute stroke and ST-elevation myocardial infarction.

Procedure:

1. Patient transportation via ground ambulance will not be delayed to wait for helicopter transportation. If the patient is packaged and ready for transport and the helicopter is not on the ground, or within a reasonable distance, the transportation will be initiated by ground ambulance.

2. Air transport should be considered if any of the following criteria apply:
   a. High priority patient with greater than 20 minute transport time
   b. Entrapped patients with greater than 10 minute estimated extrication time
   c. Multiple casualty incident with red/yellow tag patients
   d. Multi-trauma or medical patient requiring life-saving treatment not available in the prehospital environment (i.e., blood transfusion, invasive procedure, operative intervention)
   e. Time dependent medical conditions such as acute STEMI or acute stroke that could benefit from the resources at a specialty center.

3. If a potential need for air transport is anticipated, but not yet confirmed, an air medical transport service can be placed on standby.

4. If the scene conditions or patient situation improves after activation of the air medical transport service and air transport is determined not to be necessary, Paramedic or administrative personnel should cancel the request by communicating face-to-face with the on-scene Fire Department Incident Commander.

5. Minimal Information which should be provided to the air medical transport service include:
   - Number of patients
   - Age of patients
   - Sex of patients
   - Mechanism of injury or complaint (MVC, fall, etc.)
Policy:

- A burn unit may treat adults, children or both.

Purpose:

- To identify burn injuries that should be referred to a burn unit.

Procedure:

1. Refer all burns to a burn unit which include the following:
   a. Partial thickness burns greater than 10% total body surface area (TBSA).
   b. Burns that involve the face, hands, feet, genitalia, perineum, or major joints.
   c. Third-degree burns in any age group.
   d. Electrical burns, including lightning injury.
   e. Chemical burns.
   f. Inhalation injury.
   g. Burn injury in patients with preexisting medical disorders that could complicate management, prolong recovery, or affect mortality.
   h. Any patients with burns and concomitant trauma (such as fractures) in which the burn injury poses the greatest risk of morbidity or mortality. In such cases, if the trauma poses the greater immediate risk, the patient may be initially stabilized in a trauma center before being transferred to a burn unit. Physician judgment will be necessary in such situations and should be in concert with the regional medical control plan and triage protocols.
   i. Burned children in hospitals without qualified personnel or equipment for the care of children.
   j. Burn injury in patients who will require special social, emotional, or long-term rehabilitative intervention.

Excerpted from Guidelines for the Operations of Burn Units (pp. 55-62), Resources for Optimal Care of the Injured Patient: 1999, Committee on Trauma, American College of Surgeons.
Policy:

- Child abuse is the physical and mental injury, sexual abuse, negligent treatment, and/or maltreatment of a child under the age of 18 by a person who is responsible for the child's welfare.
- The recognition of abuse and the proper reporting is a critical step to improving the safety of children and preventing child abuse.

Purpose:

- Assessment of a child abuse case is based upon the following principles:
  - Protect the life of the child from harm, and the EMS team from liability.
  - Suspect that the child may be a victim of abuse, especially if the injury/illness is not consistent with the reported history.
  - Respect the privacy of the child and family.
  - Collect as much evidence as possible, especially information.

Procedure:

1. With all children, assess for and document psychological characteristics of abuse, including excessive passivity, compliant or fearful behavior, excessive aggression, violent tendencies, excessive crying, fussy behavior, hyperactivity, or other behavioral disorders.
2. With all children, assess for and document physical signs of abuse, including and especially any injuries that are inconsistent with the reported mechanism of injury.
3. With all children, assess for and document signs and symptoms of neglect, including inappropriate level of clothing for weather, inadequate hygiene, absence of attentive caregiver(s), or physical signs of malnutrition.
4. Immediately report any suspicious findings to both the receiving hospital (if transported) and to the Greenville County Department of Social Services (DSS) intake phone number at 864-467-7750. **Report should be completed on a recorded line and documented on the patient care report (PCR).**
5. While law enforcement may also be notified, South Carolina law requires the EMS provider to report the suspicion of abuse to DSS. EMS should not accuse or challenge the suspected abuser. This is a legal requirement to report, not an accusation. In the event of a child fatality, law enforcement must also be notified.
Policy:

- CPR and ALS treatment are to be withheld only if the patient is obviously dead or a valid South Carolina *Do Not Resuscitate* form is present (see Deceased Persons Protocol).

Purpose:

- To honor those who have obviously expired prior to EMS arrival.

Assessment:

- If a patient is in complete cardiopulmonary arrest (clinically dead) and meets one or more of the criteria below, CPR and ALS therapy need not be initiated:
  - Body decomposition.
  - Rigor mortis.
  - Dependent lividity.
  - Traumatic arrest in asystole or PEA <30.
  - Injury not compatible with life (i.e., decapitation, burned beyond recognition, massive open or penetrating trauma to the head or chest with obvious organ destruction).
  - Extended downtime or un-witnessed arrest with asystole on the EKG in two leads.

Procedure:

1. If a bystander or first responder has initiated CPR or automated defibrillation prior to an EMS Paramedic’s arrival and any of the above criteria (signs of obvious death) are present, the Paramedic may discontinue CPR and ALS therapy. All other EMS personnel levels must communicate with Medical Control prior to discontinuation of the resuscitative efforts.
2. If doubt exists, start resuscitation immediately. Once resuscitation is initiated, continue resuscitation efforts until either:
   a) Resuscitation efforts meet the criteria for implementing the Discontinuation of Prehospital Resuscitation Policy.
   b) Patient care responsibilities are transferred to the destination hospital staff.
   c) Orders to terminate resuscitation are received by Medical Control.
Policy:

- To aid in the notification and grieving process for family and friends after the immediate death of a loved one.

Purpose:

1. Death notification can be very complex and will have lasting impact on family and friends. Understanding the basics of human emotion and the normal reactions to traumatic events can help guide a proper notification.
2. Everyone reacts differently to death notifications; some will appear catatonic with little to no outward emotion while others will become angry and irrational.
3. The five basic stages of grief are:
   1. Denial and isolation
   2. Anger
   3. Bargaining
   4. Depression
   5. Acceptance
4. In the pre-hospital environment, it is likely that family will express all five stages of grief rapidly and while EMS is on-scene.
5. Each individual processes a death notification in their own unique manner. Be patient and courteous and allow the family member to find peace in their own way.

Procedure:

1. Delivery matters:
   a. Introduce yourself by name and get on eye level with the family member.
   b. Confirm the identity and relationship of the family member.
   c. Use a very simple one line sentence to break the news, “I am very sorry to tell you but (use the victim’s name) has died. Do not use “passed”, “expired”, or “moved on”. Also, refrain from referring to the body as a victim, patient, son, etc.
   d. Immediately inform the family member that they will be helped through the entire process.
   e. Pause and allow the family member time to process the information and ask questions.
   f. Demonstrate empathy and understanding.
   g. Ask if other family members or friends should be notified.
2. Statements to avoid:
   a. I know how you feel.
   b. You need to be strong.
   c. Calm down.
   d. God must have needed him/her more than you.
   e. Now that you know, I need to know what funeral home you would like.
   f. It could have been worse.
3. Helpful Statements:
   a. I am sorry.
   b. This is harder than most people think.
   c. Is there anyone I can contact for you?
   d. I wish I could give you an answer that could help, but I just cannot.
   e. I can only imagine how you must feel.
4. Listen; allow the family to speak and grieve. Many times they just want to be heard.
Discontinuation of Prehospital Resuscitation

Policy:
- Unsuccessful resuscitative efforts may be discontinued prior to transport or arrival at the hospital when this policy is followed.

Purpose:
- To allow for discontinuation of prehospital resuscitation after the delivery of appropriate ALS resuscitative efforts.

Procedure:
1. Discontinuation of CPR and ALS intervention for a medical cardiac arrest patient may be implemented prior to contact with Medical Control if **ALL** of the following criteria have been met:
2. Patient is 18 years of age or older.
3. Adequate CPR has been administered.
4. Airway has been successfully managed with verification by bilateral lung sounds, absence of epigastric sounds, and capnography. Acceptable management techniques include oral tracheal intubation, nasotracheal intubation, or blind insertion airway device such as the KING LT.
5. IV or IO access has been achieved.
6. Rhythm appropriate medications and defibrillation have been administered according to protocol.
7. Persistent asystole (6 seconds in two leads) is present and no reversible causes are identified after a minimum of 25 minutes of resuscitation or PEA with EtCO2 less than or equal to 10 after 25 minutes of resuscitation.
8. Failure to establish sustained palpable pulses or persistent/recurring ventricular fibrillation/tachycardia or any continued neurological activity such as eye opening or motor responses.
10. No evidence of hypothermia.
11. All EMS Paramedic personnel involved in the patient’s care agree that discontinuation of the resuscitation is appropriate.
12. The patient is in a residence (non-public place) and the scene is safe to do so.
13. If **all** of the above criteria are not met and discontinuation of prehospital resuscitation is deemed appropriate, contact Medical Control.
14. If the patient is in a public place or the scene is deemed unsafe to terminate resuscitation; work the arrest until the patient can be transferred to the ambulance. Continue resuscitation efforts, transport to the closest appropriate emergency room, and contact Medical Control for possible termination orders.
15. Traumatic arrests can be terminated on-scene without contacting Medical Control if at any point the patient presents with asystole or a wide complex PEA less than 30.
16. Document all patient care and interactions with the patient’s family, personal physician, Medical Control, Coroner, and law enforcement in the patient care report (PCR).
17. Involve the family early in the resuscitation process:
   a. Provide reassurance that everything possible is being done
   b. Ease the family into the decision to terminate resuscitation
   c. Provide emotional support
18. Contact the Coroner’s office early on patients under the age of 60 without a significant medical history.
19. If a possible Coroner case, involve family in discontinuation, but do not allow them to disturb the patient or the surroundings.
20. If the Coroner’s office releases the body, make the patient presentable by removing IV’s and airway devices and covering the patient. **Do not remove any devices prior to contacting the Coroner’s office.**
21. Whenever possible, terminate resuscitation prior to transport and follow the same procedures as if the patient was found dead on-scene.
22. Follow the **Deceased Persons Protocol.**
Policy:

Any patient presenting to any component of the EMS system with a completed and properly formatted South Carolina Do Not Resuscitate (DNR) form, and or an approved South Carolina “Do Not Resuscitate” bracelet in place shall have the order honored. Treatment will be limited as documented in the palliative care section of the SC Code of Laws Section 44-78-10 amended 1994. A living will or other legal document that identifies the patient’s desire to withhold CPR or other medical care may not be honored other than the POST form currently under pilot in South Carolina. If the patient has a Do Not Resuscitate bracelet, it must be from the official vendor “Sticky J Medical ID Company” which is pictured below.

Purpose:

- To honor the terminal wishes of a patient preventing the initiation of unwanted resuscitation in accordance with South Carolina law under the Death with Dignity Act.

Procedure:

1. When confronted with a cardiac arrest patient, the following conditions must be present and confirmed in order to honor the DNR request and withhold CPR and ALS therapy:
   A. The form(s) must be a South Carolina DNR form, “DNR” box is checked in section A of the POST form, or an approved South Carolina DNR Bracelet must be present on the patient.
   B. The effective date and all required information provided
   C. Must be signed or approved by a SC licensed physician

A valid DNR form may ONLY be revoked by VERBAL/IMPLIED request of the PATIENT ONLY or by mutilating, obliterating or destroying the document, or by removal or destruction of an approved bracelet in any manner, prior to arrival of the EMS provider.

1. If the patient or anyone associated with the patient requests that a SC DNR form not be honored, EMS personnel should contact their supervisor to obtain assistance.
2. When confronted with a seriously ill patient who is not in cardiac arrest and has a POST form, the POST form Section B shall be utilized as follows:
   a. Full Scope of Treatment box is checked: Use all appropriate measures included in Greenville County EMS system protocols to stabilize/resuscitate the patient.
   b. Limited Scope of Treatment box is checked: The maximum airway intervention is non-rebreather mask and airway suctioning. All appropriate IV medications may be utilized. No electrical therapies are to be provided.
   c. Comfort Measures box is checked: The maximum airway intervention is non-rebreather mask and airway suctioning. IV pain medications may be administered. Medical Control may be contacted to reference appropriate treatment.

1. Living wills or other documents indicating the patient’s desire to withhold CPR or other medical care may not be honored by SC paramedics
2. When in doubt – contact a supervisor immediately.
3. EMS providers can accept a copy of an original DNR form valid for that transport only after visually verifying that the properly formatted, completed SC DNR exists, and documenting that on the copy of the form.
4. The copy or original form should be scanned and attached to the ePCR if executed.
5. Any SC DNR form that is transported with the patient and is NOT executed must be returned to the patient or patient surrogate agent (POA).

Resuscitative Measures to be withheld:
- CPR
- Advanced airway management to include intubation
- Artificial ventilations
- Defibrillation
- Cardiac resuscitation medications (Atropine, Epinephrine)
- Cardiac diagnostic monitoring (12-Lead)

Approved procedures include:
- Suction
- Basic Cardiac monitoring
- Oxygen and basic airway (OPA, NPA)
- CPAP
- Control of bleeding
- Comfort care
- Pain Management

Non-cardiac resuscitation medications:
Aspirin, Nitroglycerin, Adenosine, Diltiazem and Amiodarone (for wide complex tachycardia with a pulse).
Policy:
- At the request of the fire department on-scene commander, EMS may be asked to perform firefighter rehabilitation.

Purpose:
- Provide parameters for normal vital signs.
- Identify individuals requiring treatment and transport.

Procedure
1. Encourage the removal of all PPE (including bunker pants), rest, cooling, and oral hydration.
2. Assess pulse rate. If greater than 85 percent maximum for age (see note below) perform orthostatic vitals. If pulse rate increases greater than 20 bpm or a systolic B/P drop more than 20 strongly suggest immediate IV hydration and transport.
3. Assessment of vital signs after the responder has rested for 10 minutes after their last exertion.
   a. Abnormal vital signs include:
      1. Blood pressure: systolic greater than 200 or diastolic greater than 110.
      2. Heart rate greater than 110.
      3. Respirations less than 8 or greater than 40 per minute.
      4. Temperature greater than 101.
      5. Pulse oximetry less than 90%.
      6. CO greater than 10%.
4. If any abnormal vital signs, strongly suggest rest, rehydration, and active cooling. Re-evaluate in 10 minutes and strongly suggest transport with no improvement in total rehab time of 30 minutes. Report all abnormal vital signs to the on-scene fire incident commander or rehab officer.
5. Fire personnel should not be medically cleared to return to full duty with abnormal vital signs.
6. Any person with abnormal vital signs who refuse intervention or return to full duty against medical advice will sign a refusal.
7. Transport will be encourage automatically for the following:
   b. Shortness of breath unresolved by 10 minutes of high flow O2.
   c. Heart rhythm other than normal sinus or sinus tach.
   d. Syncope, disorientation, or confusion.
   e. Vital signs that have not returned to normal limits after 30 minutes of rehabilitation.
   f. Inability to hold fluids down or vomiting.
   g. Any request for transport.

Notes: NFPA Age-Predicted 85% maximum heart rate

Policy:

- The Daniel’s Law states that a “person who abandons a newborn (infant up to 60 days old) cannot be prosecuted for abandonment if he or she takes the unharmed baby to staff or an employee of a Safe Haven. A Safe Haven is defined as “a hospital or hospital outpatient facility, a law enforcement agency, a fire station, an emergency medical services station, or any staffed house of worship during hours when the facility is staffed.” Section 63-7-40.

Purpose:

- To provide protection to infants who are placed into the custody of EMS under this law and to the EMS systems and personnel when confronted with this issue.

Procedure:

1. Follow the Universal Patient Care Protocol.
2. Follow the Newly Born Protocol as appropriate.
3. Initiate other treatment protocols as appropriate.
4. Keep infant warm.
5. Call local Department of Social Services (DSS) 864-467-7750 as soon as infant is stabilized.
6. Transport infant to GHS pediatrics.
8. Attempt to obtain the following:
   a. Medical information about the baby’s parents.
   b. If possible, name of baby’s parents (the person leaving the child does not have to reveal his or her identity).
   c. Information about the birth.
Inter-facility Medication Administration

Policy:
- Some patients may be required to be on a medication during transport. When this occurs, the inter-facility transport drugs must be initiated at the sending facility and the patient must be stabilized on the medication prior to transport.

Purpose:
- The Paramedic in charge of the call must also ensure that he/she has received adequate education and information on the inter-facility drugs to be transported with the patient (i.e. side effects, adverse reactions, etc.) prior to accepting the patient for transfer. This information is to be documented on the Inter-facility Drug Transport Form.

Procedure:
1. When the crew arrives at the sending facility, they will receive a full verbal and written report. The Paramedic in charge of the call is responsible for accepting the patient and for ensuring that the appropriate documentation has been completed. The written report and all other documentation, including SC DHEC form 3485 (1/2010) necessary for transfer will accompany the patient.

2. Paramedics are not authorized to mix inter-hospital transport drugs. If it is anticipated that the intravenous (IV) therapy will run out during transport, an additional bag of fluid should be supplied, pre-mixed, and piggybacked into the existing IV infusion before or during transport. Paramedics are not authorized to initiate any additional units of whole blood or packed cells during transport.

3. When Sodium Nitroprusside, Magnesium Sulfate, and/or Nitroglycerine are being administered, a volumetric infusion pump and a noninvasive electronic blood pressure monitor are required during transport. Patients being transported on Mannitol require an indwelling urinary catheter to be in place prior to transport.

4. Drugs will be monitored in transit by the Paramedic based upon signed, written orders of the sending physician. Only Paramedics are authorized to maintain these drugs.

5. During transfer of the patient on an inter-facility transport drug, the Paramedic may reduce or discontinue the drug in the event of adverse reaction or complication or upon the direction of on-line Medical Control. The Paramedic may increase the rate of administration only with on-line physician direction.

6. Time is of the essence in STEMI and stroke transfers. The goal is to have STEMI patients transferred within 30 minutes of arriving at a non-PCI center. To facilitate a quick transfer of patient care from the sending facility to EMS; North Greenville, Greer Memorial, and Hillcrest will attempt to have the patient on a Stryker Stretcher prior to EMS arrival.
   a. In these cases, swap stretchers with the sending facility and accept the patient on the hospital's EMS stretcher. Retrieve the EMS stretcher at the completion of the call when operationally feasible. Attempt to reduce all delays and begin transport as rapidly as possible.

7. At the completion of the call, scan the DHEC form 3485 and attach it to the electronic patient care report (PCR) in emsCharts. The hard copy can be placed in one of the secure green bags to be shredded. Additional forms, if needed, can be located on the “I” drive in the forms folder, attached to this document or in logistics.
Standard Policies

On-Scene Physicians

Policy:
- The medical direction of prehospital care at the scene of an emergency is the responsibility of those most appropriately trained in providing such care. All care should be provided within the rules and regulations of the State of South Carolina.

Purpose:
- To identify a chain of command to allow field personnel to adequately care for the patient.
- To assure the patient receives the maximum benefit from prehospital care.
- To minimize the liability of the EMS system as well as the on-scene physician.

Procedure:
1. When a non-Medical Control Physician offers assistance to EMS or the patient is being attended by a physician with whom they do not have an ongoing patient relationship, EMS personnel must review the On-Scene Physician Form with the physician. All requisite documentation must be verified and the physician must be approved by on-line Medical Control.
2. When the patient is being attended by a physician with whom they have an ongoing patient relationship, EMS personnel may follow orders given by the physician if the orders conform to current EMS guidelines, and if the physician signs the PCR. Notify Medical Control at the earliest opportunity. Any deviation from local EMS protocols requires the physician to accompany the patient to the hospital.
3. EMS personnel may accept orders from the patient’s physician over the phone with the approval of Medical Control. The Paramedic should obtain the specific order and the physician’s phone number for relay to Medical Control so that Medical Control can discuss any concerns with the physician directly.
Policy:

- For this policy to be used, the patient only needs to be in the care of police and does not have to be under police custody.
- All patients in police custody retain the right to request transport. This should be coordinated with law enforcement.

Purpose:

- To assure the patient receives the appropriate care following encounter with law enforcement.

Procedure:

1. Assess for evidence of traumatic injury or medical illness and follow appropriate protocol.
2. If a Taser® has been used, follow *Wound Care: Taser® Probe Removal Procedure* and appropriate trauma protocol.
3. If pepper spray has been used, irrigate the face and eyes and remove contaminated clothing.
   a. Assess for dyspnea, wheezing and a history of asthma or COPD.
   b. If patient has a history of a reactive airway disease or shows any signs of dyspnea or wheezing, observe for 20 minutes and follow appropriate respiratory protocol.
   c. If an asthmatic patient is exposed to pepper spray and released to law enforcement, all parties should be advised to immediately re-contact EMS if wheezing or difficulty breathing occurs.
4. Assess patient for cardiac history, chest pain, or palpitations. If patient shows cardiac related signs or symptoms, follow appropriate cardiac protocol.
5. Continue to observe for agitated delirium syndrome.
   a. Agitated delirium is characterized by marked restlessness, irritability, and/or high fever. Patients exhibiting these signs are at high risk for sudden death and should be transported to hospital by ALS personnel.
6. If restraints are necessary, follow *Behavioral Emergencies/Chemical Restraint Protocol*.
   a. Patients restrained by law enforcement devices cannot be transported in the ambulance without a law enforcement officer in the patient compartment who is capable of removing the devices.
7. If there is any doubt about the cause of the patient’s alteration in mental status, transport the patient to the hospital for evaluation.
8. Coordinate disposition with patient, law enforcement and if necessary, Medical Control.
9. Never argue with law enforcement. If law enforcement interferes with the patient’s ability to refuse or request care, attempt to obtain a police signature verifying refusal or request of care and report the incident to a supervisor.
Standard Policies

Trauma Activation (1)

Policy:

- EMS providers shall assess each adult and pediatric trauma patient using the following criteria upon contact.
- Once a level 1 or 2 trauma alert patient is identified in the field through assessment, a crew member must contact GMH via recorded line as soon as practical and provide a full report. The words “Trauma Alert” must be included in the report form by the level of activation (1 or 2).
- All patients meeting the criteria list below (Level 1, Level 2 Trauma alert) shall be transported to Greenville Memorial Hospital (Level 1 Trauma Center).
- If patient refuses transport to GMH and is deemed a “Trauma Alert” by the EMS professional, a refusal must be signed for alternate transport destination after explaining the risk of “life and limb” to the patient.
- Upon arrival in the Trauma bay EMS personnel will give a brief report to the trauma team by using the “M.I.S.T.” report.

Purpose:

- To ensure the patient receives the appropriate care following traumatic injuries.

Trauma Criteria Level 1:

A Level 1 (Full) Alert should be activated on any patient meeting one or more of the following criteria:

1. Glasgow coma score (GCS) ≤ 11
2. Injury with associated Tachycardia and poor perfusion
3. Systolic BP < 90 or for Peds ≤ 70 + 2x (age in years)
4. Respiratory rate < 10 or > 29 or when the patient is in respiratory distress, has had a pleural decompression or is intubated.
5. Penetrating injury to head, neck, torso, or extremities proximal to the elbow or knee
6. Flail chest
7. All shotgun wounds
8. Pelvic fracture to include hip dislocation with significant mechanism of injury
9. Paralysis related to trauma
10. Crushed, de-gloving, mangled, or pulseless extremity
11. Thermal injuries including 2nd or 3rd degree burns ≥ 20% TBSA
12. Electrocution with high voltage: ≥ 220 volts or > than household current
13. Active bleeding requiring a tourniquet or continuous pressure to control
14. Discretion of any trauma team member

Evidence of Poor Perfusion

- Skin pallor, cool extremities
- Weak, distal pulses
- Cyanosis/mottling, etc.

Continued on next page
Trauma Criteria Level 2:

A Level 2 (Partial) Alert should be activated on any patient meeting one or more of the following criteria after a traumatic event:

1. GCS 12 or 13
2. Ejection from automobile
3. Death of a person in the same passenger compartment
4. Falls > 15 feet or > 10 feet (for pediatrics)
5. Vehicle rollover with altered GCS
6. High-speed auto crash (collisions with speed 35 mph or greater) with high index of suspicion.
7. Auto-pedestrian/auto-bicycle injury with significant (5mph) impact
8. Pedestrian thrown or run over
9. Motorcycle crash > 20 mph or Crash with separation of rider from bike
10. Open or multiple fractures, excluding hands or feet
11. Thermal injuries including 2nd or 3rd burns between 10% to 20% BSA
12. Significant neurological deficit
13. Pregnancy > 20 weeks with significant mechanism of injury
14. Discretion of any trauma team member

**High Index of Suspicion / Factors to Consider** (For activation or upgrade in activation)

- Age > 55 years with significant mechanism of injury
- Extrication time > 20 minutes
- Cardiac or respiratory disease
- Insulin dependent diabetes
- Cirrhosis
- Morbid obesity
- Pregnancy
- Immunosuppressed patients
- Patient with bleeding disorder
- Patients on anticoagulants

</table>
Clinical Indications:

- Pre-oxygenation of the RSI candidate.

Procedure:

1. Position the patient in a semi-recumbent position (head-up greater than 20°).
2. Place a nasal cannula in the patient’s nares and connect to an oxygen regulator.
3. Place a non-rebreather or CPAP device at 5 cm H₂O over the nasal cannula and connect to a second oxygen regulator.
4. If the patient is not saturating above 90%, remove non-rebreather or CPAP and provide ventilations utilizing a bag valve mask.
5. Administer sedative.
6. Position the patient into the sniffing position and manually open the airway utilizing two hands.
7. Attempt to maintain an oxygen saturation greater than 95%.
8. Remove the nasal cannula if unable to get a high quality seal with the CPAP or bag valve mask.
10. Remove CPAP, non-rebreather mask, or bag valve mask and leave the nasal cannula flowing at 15 Lpm.
11. Intubate the trachea and confirm tube placement.
12. Remove the nasal cannula.

PEARLS:

- Apneic oxygenation can still benefit the trauma patient; keep the patient supine with spinal precautions in place and do not use CPAP.

Certification Requirements:

- The skill of apneic oxygenation can be completed by all levels of EMT. However, intubation remains strictly a Paramedic level skill. Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment should include direct observation at least once every two years.
Clinical Indications:

- Longer EMS transport distances or an inability to adequately ventilate a patient with a bag valve mask require a more advanced airway.
- Appropriate intubation is impossible due to patient access or difficult airway anatomy.
- Inability to secure an endotracheal tube in a patient who does not have a gag reflex where at least one failed intubation attempt has occurred.
- Patient must be unconscious.
- **WARNING:** This airway may not prevent aspiration of stomach contents!

Procedure:

1. Pre-oxygenate and hyperventilate the patient.
2. Select the appropriate tube size for the patient.
3. Lubricate the tube.
4. Grasp the patient’s tongue and jaw with your gloved hand and pull forward.
5. Gently insert the tube rotated laterally 45°-90° so that the blue orientation line is touching the corner of the mouth. Once the tip is at the base of the tongue, rotate the tube back to midline. Insert the airway until the base of the connector is in line with the teeth and gums.
6. Inflate the pilot balloon with 45 - 90 mL of air depending on the size of the device used.
7. **Ventilate the patient while gently withdrawing the airway until the patient is easily ventilated**.
8. Auscultate for breath sounds over the lungs and epigastrium and look for the chest to rise and fall.
9. Secure the tube to the patient’s face.
10. **Confirm tube placement using end-tidal CO2 detector**.
11. It is required the airway be monitored continuously through waveform capnography and pulse oximetry.
12. Complete an airway evaluation form with any BIAD use.

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system. Assessment should include direct observation at least once per certification cycle.
Clinical Indications:

- Reactive airway disease patients with suspected inadequate ventilation, adequate mental status and enough respiratory drive to allow CPAP to function.
- For apneic oxygenation where the patient has an adequate respiratory drive and the airway is able to be manually opened and maintained. This includes CHF, pneumonia, asthma, and COPD.

Contraindications:

- Facial features or deformities that prevent an adequate mask seal.
- Excessive respiratory secretions.
- Inability to maintain own airway.
- Hypotension (systolic blood pressure below 90mm/hg)

Procedure:

1. Ensure adequate oxygen supply to ventilation device.
2. Explain the procedure to the patient.
3. Consider placement of a nasopharyngeal airway.
4. Place the delivery mask over the mouth and nose. **Oxygen** should be flowing through the device at this point.
5. Secure the mask with provided straps starting with the lower straps until minimal air leak occurs.
6. For reactive airway disease (i.e., COPD) set the positive end expiratory pressure (PEEP) at 3-5 cm H₂O. Use the lowest possible setting to avoid barotrauma.
7. For pulmonary edema, near drowning, aspiration and pneumonia set the PEEP at 5-10 cm H₂O. Use the lowest possible setting to avoid barotrauma.
8. For apneic oxygenation set the PEEP at 5 cm H₂O.
9. Evaluate the response of the patient by assessing breath sounds, oxygen saturation, and general appearance.
10. Oxygen levels should be titrated to the patient’s response. Many patients respond to lower FiO₂ (30%-50%).
11. Encourage the patient to allow forced ventilation to occur. Observe closely for signs of complications. The patient must be breathing for optimal use of the CPAP device.

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
- CPAP application can be completed by all levels of EMT, however, the Paramedic must be the primary attendant.
Clinical Indications:

- Patient meets clinical indications for oral intubation.

Contraindications:

- Three attempts at oral tracheal intubation (follow Airway Protocol).
- Age less than 8 or endotracheal tube size less than 6.5 mm.

Procedure:

1. Prepare, position and oxygenate the patient with 100% Oxygen.
2. Select proper endotracheal tube (ETT) without stylet, test cuff and prepare suction.
3. Lubricate the distal end and cuff of the ETT and the distal 1/2 of the endotracheal tube introducer (Bougie®) (note: failure to lubricate the Bougie® and the ETT may result in being unable to pass the ETT.
4. Using laryngoscopic techniques, visualize the vocal cords if possible using Sellick’s/BURP as needed.
5. Introduce the Bougie® with curved tip anteriorly and visualize the tip passing the vocal cords or above the arytenoids if the cords cannot be visualized.
6. Once inserted, gently advance the Bougie® until you meet resistance or “hold-up” (if you do not meet resistance you have a probable esophageal intubation and insertion should be reattempted or the Airway Protocol implemented as indicated).
7. Withdraw the Bougie® ONLY to a depth sufficient to allow loading of the ETT while maintaining proximal control of the Bougie®.
8. Gently advance the Bougie® and loaded ETT until you have hold-up again, thereby assuring tracheal placement and minimizing the risk of accidental displacement of the Bougie®.
9. While maintaining a firm grasp on the proximal Bougie®, introduce the ETT over the Bougie® passing the tube to its appropriate depth.
10. If you are unable to advance the ETT into the trachea and the Bougie® and ETT are adequately lubricated, withdraw the ETT slightly and rotate the ETT 90° COUNTER clockwise to turn the bevel of the ETT posteriorly. If this technique fails to facilitate passing of the ETT you may attempt direct laryngoscopy while advancing the ETT (this will require an assistant to maintain the position of the Bougie® and, if so desired, advance the ETT).
11. Once the ETT is correctly placed, hold the ETT securely and remove the Bougie®.
12. Inflate the cuff with 3 to 10 mL of air, auscultate for equal breath sounds and reposition accordingly.
13. Confirm and document tracheal placement using end-tidal CO2 monitoring or an esophageal bulb device.
14. When final position is determined, secure the ETT, reassess breath sounds and monitor readings to assure continued tracheal intubation.

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system. Assessment should include direct observation at least once per certification cycle.
Clinical Indications:

- Sudden onset of respiratory distress often with coughing, wheezing, gagging, or stridor due to a foreign-body obstruction of the upper airway.

Procedure:

1. Assess the degree of foreign body obstruction.
   a. Do not interfere with a mild obstruction allowing the patient to clear their airway by coughing.
   b. In severe foreign body obstructions, the patient may not be able to make a sound. The victim may clutch his/her neck in the universal choking sign.
2. **For an infant**, deliver 5 back blows (slaps) followed by 5 chest thrusts repeatedly until the object is expelled or the victim becomes unresponsive.
3. **For a child**, perform a sub-diaphragmatic abdominal thrust (Heimlich maneuver) until the object is expelled or the victim becomes unresponsive.
4. **For adults**, a combination of maneuvers may be required.
   - First, sub-diaphragmatic abdominal thrusts (Heimlich maneuver) should be used in rapid sequence until the obstruction is relieved.
   - If abdominal thrusts are ineffective, chest thrusts should be used. Chest thrusts should be used primarily in morbidly obese patients and in the patients who are in the late stages of pregnancy.
5. If the victim becomes unresponsive, begin CPR immediately but look in the mouth before administering any ventilations. If a foreign body is visible, remove it.
6. **Do not perform blind finger sweeps in the mouth and posterior pharynx. This may push the object farther into the airway.**
7. In unresponsive patients, Paramedic level professionals should visualize the posterior pharynx with a laryngoscope to potentially identify and remove the foreign body using Magill® forceps.
8. Document the methods used and result of these procedures in the patient care report (PCR).

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- A spontaneously breathing patient in need of intubation (i.e., inadequate respiratory effort, evidence of hypoxia or carbon dioxide retention, or need for airway protection).
- Rigidity or clenched teeth prohibiting other airway procedures.
- Patient must be 12 years of age or older or >55 kg.

Procedure:

1. Select the largest and least obstructed nostril and insert a lubricated nasal airway to help dilate the nasal passage.
2. Pre-oxygenate the patient. Lubricate the tube with **Lidocaine jelly**. The use of a BAAM® device is recommended.
3. Remove the nasal airway and gently insert the tube keeping the bevel of the tube toward the septum.
4. Continue to pass the tube listening for air movement and looking for “to-and-fro” vapor condensation in the tube. As the tube approaches the larynx, the air movement gets louder.
5. Gently and evenly advance the tube through the glottic opening on the inspiration. This facilitates passage of the tube and reduces the incidence of trauma to the vocal cords.
6. Upon entering the trachea, the tube may cause the patient to cough, buck, strain, or gag. Do not remove the tube! This is normal, but be prepared to control the cervical spine and the patient, and be alert for vomiting.
7. Auscultate for bilaterally equal breath sounds and absence of sounds over the epigastrium.
8. Observe for symmetrical chest expansion. The 15 mm adapter usually rests close to the nostril with proper positioning.
9. Inflate the cuff with 5-10 mL of air.
10. **Confirm tube placement using end-tidal CO₂ monitoring or an esophageal bulb device.**
11. Secure the tube to the patient’s face.
12. Reassess airway and breath sounds after transfer to the stretcher and during transport. These tubes are easily dislodged and require close monitoring and frequent reassessment.
13. Document the procedure, time, and result (success) on/with the patient care report (PCR).
14. **It is required that the airway be monitored continuously through waveform capnography and pulse oximetry.**

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- Longer EMS transport distances or an inability to adequately ventilate a patient with a bag valve mask require a more advanced airway.
- An unconscious patient without a gag reflex who is apneic or is demonstrating inadequate respiratory effort.

Procedure:

1. Prepare, position and oxygenate the patient with 100% Oxygen.
2. Select proper endotracheal tube (ETT) (and stylet, if used) (No ETT larger than a 7.5), have suction ready.
3. Utilize endotracheal tube introducer (Bougie®) according to Airway: Endotracheal Tube Introducer (Bougie®) Procedure.
4. Using laryngoscope, visualize vocal cords (use Sellick maneuver/BURP to assist).
5. Limit each intubation attempt to 30 seconds with bag valve mask between attempts.
6. Visualize tube passing through vocal cords.
7. Confirm and document tube placement using end-tidal CO₂ monitoring or an esophageal bulb device.
8. Inflate the cuff with 3 to 10 mL of air; secure the tube to the patient’s face.
9. Auscultate for bilaterally equal breath sounds and absence of sounds over the epigastrium. If you are unsure of placement, remove tube and ventilate patient with bag valve mask.
10. Apply waveform capnography monitor. After 3 ventilations, EtCO₂ should be greater than 10 or comparable to pre-intubation values. If less than 10, check for adequate circulation, equipment, and ventilatory rate. If EtCO₂ is still less than 10 without physiologic explanation, remove the ETT and ventilate by bag valve mask.
11. Consider using a blind insertion airway device if intubation efforts are unsuccessful.
12. Apply end tidal carbon dioxide monitor (waveform capnography) and record readings on scene, en route to the hospital, and at the hospital.
13. Document ETT size, time, result (success), and placement location by the centimeter marks either at the patient’s teeth or lips on/with the patient care report (PCR). Document all devices used to confirm initial tube placement. Also document positive or negative breath sounds before and after each movement of the patient.
14. It is required that the airway be monitored continuously through waveform capnography and pulse oximetry.

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system. Assessment should include direct observation at least once per certification cycle.
Clinical Indications:

- Longer EMS transport distances or an inability to adequately ventilate a patient with a bag valve mask require a more advanced airway.
- Inability to secure an endotracheal tube in a patient who does not have a gag reflex where at least one failed intubation attempt has occurred.
- Appropriate intubation is impossible due to patient access or difficult airway anatomy.
- **WARNING:** This airway does not prevent aspiration of stomach contents!

Clinical Contraindications:

- Deforming facial trauma.
- Pulmonary fibrosis.
- Morbid obesity.

Procedure:

1. Check the tube for proper inflation and deflation.
2. Lubricate with a water-soluble jelly.
3. Pre-oxygenate the patient with 100% Oxygen.
4. Insert the LMA into the hypopharynx until resistance is met.
5. Inflate the cuff until a seal is obtained.
6. Connect the LMA to an amбу bag and assess for breath sounds and air entry.
7. **Confirm tube placement using end-tidal CO₂ detector or esophageal bulb device.**
8. Secure the tube to the patient’s face.
9. Monitor oxygen saturation with pulse oximetry and heart rhythm with EKG.
10. **It is required that the airway be monitored continuously through waveform capnography and pulse oximetry.**
11. Re-verify LMA placement after every move and upon arrival in the emergency department.
12. Document the procedure, time, and result (success) on/with the patient care report (PCR).
13. **Complete an airway evaluation form with all intubations.**

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system. Assessment should include direct observation once per certification cycle.
Clinical Indications:
- Presence of tracheostomy site.
- Urgent or emergent indication to change the tube, such as obstruction that will not clear with suction, dislodgement, or inability to oxygenate or ventilate the patient without other obvious explanation.

Procedure:
1. Have all airway equipment prepared for standard airway management, including equipment for oral tracheal intubation and failed airway.
2. Have airway device (endotracheal tube or tracheostomy tube) of the same size as the tracheostomy tube currently in place as well as 0.5 size smaller available (i.e., if the patient has a 6.0 Shiley, then have a 6.0 and a 5.5 tube).
3. Lubricate the replacement tube(s) and check the cuff.
4. Remove the tracheostomy tube from mechanical ventilation devices and use a bag-valve apparatus to pre-oxygenate the patient as much as possible.
5. Once all equipment is in place, remove devices securing the tracheostomy tube, including sutures and/or supporting bandages.
6. If applicable, deflate the cuff on the tube. If unable to aspirate air with a syringe, cut the balloon off to allow the cuff to lose pressure.
7. Remove the tracheostomy tube.
8. Insert the replacement tube. Confirm placement via standard measures except for esophageal detection (which is ineffective for surgical airways).
9. If there is any difficulty placing the tube, re-attempt procedure with the smaller tube.
10. If difficulty is still encountered, use standard airway procedures such as oral bag-valve mask or endotracheal intubation (as per protocol). **More difficulty with tube changing can be anticipated for tracheostomy sites that are immature – e.g. less than two weeks old. Great caution should be exercised in attempts to change immature tracheotomy sites.**

Certification Requirements:
- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- Capnography shall be used when available with the use of all invasive airway procedures including endotracheal, nasotracheal, cricothyrotomy, or blind insertion airway devices (BIAD).
- Capnography should also be used when possible with CPAP and when administering narcotics and/or sedatives.

Procedure:

1. Select the appropriate EtCO₂ accessory for the patient.
2. Open the CO₂ port door and insert the FilterLine connector; turn connector clockwise until tight.
3. Verify that the CO₂ area is displayed.
4. Using the speed dial, select waveform in either channel 2 or 3 or select capnography after pressing the LEAD button.
5. Connect the CO₂ FilterLine set to the patient via BIAD, endotracheal tube, or oxygen delivery device.
6. Confirm that the EtCO₂ value and waveform are displayed. The monitor automatically selects the scale for the best visualization of the waveform. You can change the scale, if desired, using the speed dial knob.
7. A CO₂ waveform appears when any CO₂ is detected, but CO₂ must be greater than 3.5 mmHg for a numerical value to be displayed. However, the CO₂ module will not recognize a breath until the CO₂ is at least 8 mmHg.
8. Note CO₂ level and waveform changes on each respiratory failure, cardiac arrest, or respiratory distress patient.
9. The capnometer shall remain in place with the airway and be monitored throughout prehospital care.
10. Loss of CO₂ detection or waveform usually indicates an airway problem and should be documented.
11. Document the procedure and results on/with the patient care report (PCR) and the airway evaluation form.

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- Patients experiencing bronchospasm.

Procedure:

1. Gather the necessary equipment.
2. Assemble the nebulizer kit.
3. Instill the premixed drug (such as Albuterol (Ventolin) or other approved drug) into the reservoir well of the nebulizer.
4. Connect the nebulizer device to Oxygen at 4 to 6 liters per minute or adequate flow to produce a steady, visible mist.
5. Instruct the patient to inhale normally through the mouthpiece of the nebulizer. The patient needs to have a good lip seal around the mouthpiece.
   a. Consider using aerosol mask as needed
   b. Consider using CPAP to assist in administration is severe respiratory distress patients
6. The treatment should last until the solution is depleted. Tapping the reservoir well near the end of the treatment will assist in utilizing all of the solution.
7. Monitor the patient for medication effects. This should include the patient’s assessment of his/her response to the treatment and reassessment of vital signs, EKG, and breath sounds.
8. Document the treatment, dose, and route on/with the patient care report (PCR).

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:
- Any patient with pain.

Definitions:
- Pain is an unpleasant sensory and emotional experience associated with actual or potential tissue damage.
- Pain is subjective (whatever the patient says it is).

Procedure:
1. Initial and ongoing assessment of pain intensity and character is accomplished through the patient’s self-report.
2. Pain should be assessed and documented in the patient care report (PCR) during initial assessment, before starting pain control treatment, and with each set of vitals.
3. Pain should be assessed using the appropriate approved scale.
4. Three pain scales are available: the 0-10, the Wong-Baker “faces”, and the FLACC.
   a. 0-10 scale: the most familiar scale used by EMS for rating pain with patients. It is primarily for adults and is based on the patient being able to express their perception of the pain as related to numbers. Avoid coaching the patient; simply ask them to rate their pain on a scale from 0-10, where 0 is no pain at all and 10 is the worst pain ever.
   b. Wong-Baker “FACES” scale: this scale is primarily for use with pediatrics but may also be used with geriatrics or any patient with a language barrier. The faces correspond to numeric values from 0-10. This scale can be documented with the numeric value.
   c. FLACC scale: this scale has been validated for measuring pain in children with mild to severe cognitive impairment and in pre-verbal children (including infants).

Certification Requirements:
- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- Patients with suspected hypoxemia.

Procedure:

1. Apply probe to patient’s finger or any other digit as recommended by the device manufacturer.
2. Allow machine to register saturation level.
3. Record time and initial saturation percent on room air if possible on/with the patient care report (PCR).
4. Verify pulse rate on machine with actual pulse of the patient.
5. Monitor critical patients continuously until arrival at the hospital. If recording a one-time reading, monitor patients for a few minutes as oxygen saturation can vary.
6. Document percent of oxygen saturation every time vital signs are recorded and in response to therapy to correct hypoxemia.
7. In general, normal saturation is 97%-99%. Below 92%-94%, suspect a respiratory compromise, which may or may not be a chronic condition (e.g., COPD).
8. Use the pulse oximetry as an added tool for patient evaluation. Treat the patient, not the data provided by the device.
9. The pulse oximeter reading should never be used to withhold Oxygen from a patient in respiratory distress or when it is the standard of care to apply Oxygen despite good pulse oximetry readings, such as chest pain. Supplemental Oxygen is not required if the oxyhemoglobin saturation is greater than or equal to 94%. If there are obvious signs of ischemia, heart failure, dyspnea, or hypoxia, the goal is to maintain saturation between 90%-99% depending on patient condition.
10. Factors which may reduce the reliability of the pulse oximetry reading include but are not limited to:
   a. Poor peripheral circulation (i.e., blood volume, hypotension, hypothermia).
   b. Excessive pulse oximeter sensor motion.
   c. Fingernail polish (may be removed with acetone pad).
   d. Carbon monoxide bound to hemoglobin.
   e. Irregular heart rhythms (e.g., atrial fibrillation, SVT, etc.).
   f. Jaundice.
   g. Placement of blood pressure cuff on same extremity as pulse oximetry probe.

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:
- Suspected cardiac patient.
- Suspected tricyclic overdose.
- Electrical injuries.
- Syncope.

Procedure:
1. Assess patient and monitor cardiac status.
2. Administer **Oxygen** as patient condition warrants.
3. If patient is unstable, definitive treatment is the priority. If patient is stable or stabilized after treatment, perform a 12-Lead EKG.
4. Prepare EKG monitor and connect patient cable with electrodes.
5. Enter the required patient information (patient name, etc.) into the EKG device.
6. Expose chest and prep as necessary. Modesty of the patient should be respected.
7. Apply chest leads and extremity leads using the following landmarks:
   - RA: Right arm
   - LA: Left arm
   - RL: Right leg
   - LL: Left leg
   - V1: 4th intercostal space at right sternal border
   - V2: 4th intercostal space at left sternal border
   - V3: Directly between V2 and V4
   - V4: 5th intercostal space at midclavicular line
   - V5: Level with V4 at left anterior axillary line
   - V6: Level with V5 at left midaxillary line
8. Instruct the patient to remain still.
9. Press the appropriate button to acquire the 12-Lead EKG.
10. If the monitor detects signal noise (such as patient motion or a disconnected electrode), the lead acquisition will be interrupted until the noise is removed.
11. If an inferior infarct is suspected, obtain a right-sided and posterior (15-Lead) EKG.
12. For a 15-Lead EKG apply chest leads using the following landmarks:
   - V7: Use lead V4 and place on right side 5th intercostal space at midclavicular line
   - V8: Use lead V5 and place under left scapula at midclavicular line
   - V9: Use lead V6 and place under tip of left scapula
13. Once acquired, transmit the 12-Lead EKG data by fax to the appropriate hospital and notify the hospital of the 12-Lead EKG transmission. **Do not transmit the 15-Lead EKG.**
14. Monitor the patient while continuing with the treatment protocol.
15. Download data as per guidelines and attach a copy of the EKG’s to the patient care report (PCR).
16. Document the procedure, time, and results on/with the PCR.

Certification Requirements:
- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- Patients with symptomatic bradycardia (less than 60 per minute) with signs and symptoms of inadequate cerebral or cardiac perfusion such as:
  - Chest pain.
  - Hypotension.
  - Pulmonary edema.
  - Altered mental status, confusion, etc.
  - Ventricular ectopy.

Procedure:

1. Attach standard 4-Lead monitor.
2. Apply defibrillation/pacing pads to right upper chest and left lower chest as indicated by picture on pads.
3. Select pacing option on monitor unit.
4. Adjust heart rate to 70 BPM for an adult and appropriate BPM for a child as indicated by appropriate protocol.
5. Note pacer spikes on EKG screen.
6. Slowly increase output until capture of electrical rhythm on the monitor.
7. If unable to capture while at maximum current output, stop pacing immediately.
8. If capture observed on monitor, check for corresponding pulse and assess vital signs.
9. Consider the use of sedation or analgesia if patient is uncomfortable.
10. Document the dysrhythmia and the response to external pacing with EKG strips in the patient care report (PCR).

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system. Assessment should include direct observation at least once per certification cycle.
Clinical Indications:

- Imminent delivery with crowning.

Procedure:

1. Delivery should be monitored so as to allow a slow controlled delivery of the infant. This will prevent injury to the mother and infant.
2. Support the infant’s head as needed.
3. Check the umbilical cord surrounding the neck. If it is present, slip it over the head. If unable to free the cord from the neck, double clamp the cord and cut between the clamps.
4. Suction the airway with a bulb syringe beginning with the mouth.
5. Grasping the head with hands over the ears, gently pull down to allow delivery of the anterior shoulder.
6. Gently pull up on the head to allow delivery of the posterior shoulder.
7. Slowly deliver the remainder of the infant.
8. Clamp the cord 2 inches from the abdomen with 2 clamps and cut the cord between the clamps.
9. Record APGAR scores at 1 and 5 minutes.
11. The placenta should deliver spontaneously, usually within 5 minutes of the infant. Do not force the placenta to deliver.
12. Massaging the uterus may facilitate delivery of the placenta and decrease bleeding by facilitating uterine contractions.
13. Continue rapid transport to the hospital.

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- Any patient who may have been exposed to significant hazardous materials, including chemical, biological, or radiological weapons.

Procedure:

1. In coordination with HazMat and other emergency management personnel, establish hot, warm and cold zones of operation.
2. Ensure that personnel assigned to operate within each zone have proper personal protective equipment.
3. In coordination with other public safety personnel, assure each patient from the hot zone undergoes appropriate initial decontamination. This is specific to each incident; such decontamination may include:
   a. Removal of patients from hot zone.
   b. Simple removal of clothing.
   c. Irrigation of eyes.
   d. Passage through high-volume water bath (e.g., between two fire apparatus) for patients contaminated with liquids or certain solids. Patients exposed to gases, vapors, and powders often will not require this step as it may unnecessarily delay treatment and/or increase dermal absorption of the agent(s).
4. Initial triage of patients should occur after step 3. Immediate life threats should be addressed prior to technical decontamination.
5. Assist patients with technical decontamination (unless contraindicated based on 3 above). This may include removal of all clothing and gentle cleansing with soap and water. All body areas should be thoroughly cleansed, although overly harsh scrubbing which could break the skin should be avoided.
6. Place triage identification on each patient. Match triage information with each patient’s personal belongings which were removed during technical decontamination. Preserve these personnel affects for law enforcement.
7. Monitor all patients for environmental illness.
8. Transport patients per appropriate protocol.

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

To relieve tension pneumothorax
- Signs and symptoms include:
  - Decreased or absent breath sounds with:
  - History consistent with suspected tension pneumothorax
  - Chest trauma or COPD or Positive pressure ventilation
  - Shock or rapidly decreasing blood pressure
  - Progressive respiratory distress
  - Tracheal deviation away from the affected side
  - Jugular vein distension
  - Asymmetrical chest movement with inspiration
  - Also consider flail segment
  - Hyper-expanded chest on affected side
  - Drum like percussion on affected side
  - Increased resistance to positive pressure ventilation, especially if intubated

Procedure:

- Elevate head of stretcher to 30 degrees.
- Expose the entire chest.
- Identify the second intercostal space midclavicular on the side of the pneumothorax.
  - Place finger on the clavicle at its midpoint.
  - Run this finger straight down the chest wall to locate the first palpable rib between the clavicle.
  - The second intercostal space lies just below this rib, midway between the clavicle and the nipple line.
- Cleanse the area with an alcohol or providone-iodine swab.
- Select a 12 or 14 gauge (at least) 3” IV catheter (Pediatric: 16 gauge, 1 ¼ inch).
- Advance the needle into the second intercostal space above the third rib. Assure you enter the thoracic cavity by passing the needle just over the top of the rib to avoid interference with the blood vessels and nerves that run along the underside of the rib.
- As you enter the pleural space, you will feel a pop and note a rush of air expelling.
- Advance the catheter into the chest and then withdraw the needle. Be careful not to kink the catheter.
- Auscultate breath sounds.
- Secure with gauze and tape.
- Ventilate and monitor ETCO2.

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- When medication administration is necessary and the medication must be given via the subcutaneous (SQ) (not auto-injector) or intramuscular (IM) route or as an alternative route in selected medications.

Procedure:

1. Receive and confirm medication order or perform according to standing orders.
2. Prepare equipment and medication expelling air from the syringe.
3. Explain the procedure to the patient and reconfirm patient allergies.
4. The most common site for SQ injection is the arm.
   a. Injection volume should not exceed 1 mL.
5. The possible injection sites for IM injections include the arm, buttock and thigh.
   a. Injection volume should not exceed 1 mL for the arm.
   b. Injection volume should not exceed 5 mL in the thigh or buttock. Multiple sites may be necessary in cases of Magnesium Sulfate administration.
6. The thigh should be used for injections in pediatric patients and injection volume should not exceed 1 mL.
7. Expose the selected area and cleanse the injection site with alcohol.
8. Insert the needle into the skin with a smooth, steady motion.
   **SQ: 45° angle, skin pinched**  **IM: 90° angle, skin flattened**
10. Inject the medication.
11. Withdraw the needle quickly and dispose of properly without recapping.
12. Apply pressure to the site.
13. Monitor the patient for the desired therapeutic effects as well as any possible side effects.
14. Document the medication, dose, route, and time on/with the patient care report (PCR).

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:
- Inability to obtain adequate peripheral access.
- Access of an existing venous catheter for medication or fluid administration.
- Central venous access in a patient in cardiac arrest.

Procedure:
1. Clean the port of the catheter with alcohol wipe.
2. Using sterile technique, withdraw 5-10 mL of blood and discard syringe in sharps container.
3. Using 5 mL of Normal Saline access the port with sterile technique and gently attempt to flush the saline.
4. If there is no resistance, no evidence of infiltration (e.g. no subcutaneous collection of fluid), and no pain experienced by the patient, proceed to step 5. If there is resistance, evidence of infiltration, pain experienced by the patient, or any concern that the catheter may be clotted or dislodged, do not use the catheter.
5. Begin administration of medications or IV fluids slowly and observe for any signs of infiltration. If difficulties are encountered, stop the infusion and reassess.
6. Record procedure, any complications, and fluids/medications administered in the patient care report (PCR).

The Broviac® catheter and the Hickman® catheter are temporary IV lines placed into a vein in the chest. The Broviac® is smaller than the Hickman® and therefore used for pediatric patients. These catheters are soft and come in double and triple lumens (as shown above).

The Groshong® catheter is similar to the Hickman but includes a valve at the tip of the catheter which reduces the amount of Heparin needed in the line. Used mainly for pediatric patients.

Peripherally inserted central catheter (PICC) is a 20-24 inch soft IV line which is inserted in the patient’s arm and threaded into the heart. These catheters come in single or double lumens.

Certification Requirements:
- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- External jugular (EJ) vein cannulation is indicated in a critically ill patient greater than 12 years of age who requires intravenous (IV) access for fluid or medication administration and in whom an extremity vein is not obtainable. Consider intraosseous (IO) access in addition to or instead of an EJ attempt.
- EJ cannulation may be attempted initially in life threatening events where no obvious peripheral site is noted.

Procedure:

1. Place the patient in a supine head down position. This helps distend the vein and prevents air embolism.
2. Turn the patient’s head toward the opposite side if no risk of cervical injury exists.
3. Prep the skin with an antiseptic solution.
4. Align the catheter with the vein and aim toward the same side shoulder.
5. Compressing the vein lightly with one finger above the clavicle, puncture the vein midway between the angle of the jaw and the clavicle and cannulate the vein in the usual method.
6. Attach the IV and secure the catheter avoiding circumferential dressing or taping.
7. Document the procedure, time, and result (success) on/with the patient care report (PCR).

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:
- Any patient where intravenous (IV) access is indicated (significant trauma or mechanism, emergent or potentially emergent medical condition).

Procedure:
1. Saline locks may be used as an alternative to an IV tubing and IV fluid in every protocol at the discretion of the ALS professional.
2. May use intraosseous (IO), External jugular (EJ), or preexisting venous catheter where threat to life exists and no obvious peripheral site is noted.
3. Use the largest catheter bore necessary based upon the patient’s condition and size of veins.
4. Fluid and setup choice is preferably:
   a. Lactated Ringers with a macro drip (10 gtt/mL) for trauma or hypovolemia.
   b. Normal Saline with a macro drip (10 gtt/mL) for medical conditions, and
   c. Normal Saline with a micro drip (60 gtt/mL) for medication infusions.
5. Inspect the IV solution for expiration date, cloudiness, discoloration, leaks, or the presence of particles.
6. Connect IV tubing to the solution in a sterile manner. Fill the drip chamber half full and then flush the tubing bleeding all air bubbles from the line.
7. Place a tourniquet around the patient’s extremity to restrict venous flow only.
8. Upper extremity IV sites are preferable to lower extremity sites.
9. Lower extremity IV sites are discouraged in patients with vascular disease or diabetes.
10. In post-mastectomy patients, avoid IV, blood draw, injection, or blood pressure in arm on affected side.
11. Select a vein and an appropriate gauge catheter for the vein and the patient’s condition.
12. Prep the skin with an antiseptic solution.
13. Insert the needle with the bevel up into the skin in a steady, deliberate motion until the bloody flashback is visualized in the catheter.
14. Advance the catheter into the vein. Never reinsert the needle through the catheter. Dispose of the needle into the proper container without recapping.
15. Remove the tourniquet and connect the IV tubing or saline lock.
16. Open the IV to assure free flow of the fluid and then adjust the flow rate as per protocol or as clinically indicated.
   a. Rates are preferably:
      o Adult: KVO: 60 mL/hr (1 gtt/6 sec for a macro drip set).
      o Pediatric: KVO: 30 mL/hr (1 gtt/12 sec for a macro drip set).
   b. If shock is present:
      o Adult: 500 mL fluid boluses repeated as long as lungs are dry and blood pressure is less than 90.
17. All IV rates should be at KVO (minimal rate to keep vein open) unless administering fluid bolus.
18. Consider a second IV line.
19. Pediatric: 20 mL/kg boluses repeated PRN for poor perfusion.
20. Cover the site with a sterile dressing and secure the IV and tubing.
21. Document the procedure, time and result (success) on/with the patient care report (PCR).

Certification Requirements:
Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:
- Where rapid, regular intravenous (IV) access is unavailable with any of the following:
  - Cardiac arrest (may be used as a first line vascular access).
  - Multisystem trauma with severe hypovolemia.
  - Severe dehydration with vascular collapse and/or loss of consciousness.
  - Respiratory failure/respiratory arrest.
  - Require life-saving medications that cannot be administered intramuscular (IM) or subcutaneous (SQ).

Contraindications:
- Fracture in bone or joint replacement of intraosseous (IO) site.
- Current or prior infection at proposed IO site.
- Previous IO insertion at proposed site within 48 hours.
- Inability to find landmarks (e.g., proximal humerus on small pediatrics).

Sites:
1. Proximal humerus (preferred site, > 12 years of age)
   a. Place the patient’s palm on the umbilicus and elbow on the ground or stretcher or place the patient’s arm flat on the ground or stretcher with the palm facing downward.
   b. Use your thumb to identify humeral shaft, slide thumb towards humeral head with firm pressure. Locate tubercule by prominent bulge.
   c. Use the opposite hand to pinch interior and anterior humerus ensuring that you are midline on the humerus. If necessary, for further confirmation, locate the inter-tubercular groove.
   d. With your finger on the insertion site, keeping the arm adducted, externally rotate the humerus 90°. You may be able to feel the inter-tubercular groove.
   e. Rotate the arm back to the original position for insertion. The insertion site is 1-2 cm lateral to the inter-tubercular groove.
2. Proximal tibia
   a. Identify the tibial tuberosity located 2 finger-breaths below the base of the patella.
   b. The insertion site is 1-2 cm medical from this bony prominence on the superior portion of the flat aspect of the proximal tibia. Rotating the leg laterally can aid in positioning the site anterior.

Procedure:
1. Cleanse site using antiseptic agent and allow to air dry thoroughly.
2. Connect appropriate needle set to driver and stabilize site.
3. Remove needle cap and position the driver at the insertion site with the needle set at a 90° angle to the bone surface.
4. Gently pierce the skin with the needle tip until the tip touches the bone.
5. The 5 mm mark must be visible above the skin for confirmation of adequate needle length.
6. Gently drill into the bone 2 cm or until the hub reaches the skin in an adult.
   a. Stop when you feel the “pop” or “give” in infants.
7. Hold the hub in place and pull the driver straight off. Continue to hold the hub while twisting the stylet off the hub with counter clockwise rotations.
   a. The needle should feel firmly seated in the bone (1st confirmation of placement).
8. Place the stylet in a sharps container and secure site with EZ stabilizer and connect primed EZ-connect extension set to the hub, firmly secure by twisting clockwise.
9. Flush the catheter with 5-10 mL Normal Saline adults (2-3 mL pediatric); look for infiltration (2nd confirmation of placement).
   a. If the patient is responsive to pain, administer 40 mg (2 mL) 2% Lidocaine, slow IV over 90 seconds for anesthetic effect prior to the saline flush. May repeat as needed up to 60 mg.
10. Begin infusion utilizing a pressure delivery system and continue to monitor extremity for complications.
11. Any prehospital fluids or medications approved for intravenous (IV) use may be given IO.
12. Document the procedure, time, and result (success) on/with the patient care report (PCR).

Certification Requirements:
- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Venous Access: Intraosseus (Pediatric, <12)

Clinical Indications:
- Where rapid, regular intravenous (IV) access is unavailable with any of the following:
  - Cardiac arrest (may be used as a first line vascular access).
  - Multisystem trauma with severe hypovolemia.
  - Severe dehydration with vascular collapse and/or loss of consciousness.
  - Respiratory failure/respiratory arrest.
  - Require life-saving medications that cannot be administered intramuscular (IM) or subcutaneous (SQ).

Contraindications:
- Fracture in bone or joint replacement of intraosseous (IO) site.
- Current or prior infection at proposed IO site.
- Previous IO insertion at proposed site within 48 hours.
- Inability to find landmarks (e.g., proximal humerus on small pediatrics).

Sites:
1. Proximal tibia (Preferred site <12 years of age)
   a. Identify the tibial tuberosity located 2 finger-breaths below the base of the patella.
   b. The insertion site is 1-2 cm medial from this bony prominence on the superior portion of the flat aspect of the proximal tibia. Rotating the leg laterally can aid in positioning the site anterior.

Procedure:
1. Cleanse site using antiseptic agent and allow to air dry thoroughly.
2. Connect appropriate needle set to driver and stabilize site.
3. Remove needle cap and position the driver at the insertion site with the needle set at a 90° angle to the bone surface.
4. Gently pierce the skin with the needle tip until the tip touches the bone.
5. The 5 mm mark must be visible above the skin for confirmation of adequate needle length.
6. Gently drill into the bone 2 cm or until the hub reaches the skin in an adult.
   a. Stop when you feel the “pop” or “give” in infants.
7. Hold the hub in place and pull the driver straight off. Continue to hold the hub while twisting the stylet off the hub with counter clockwise rotations.
   a. The needle should feel firmly seated in the bone (1st confirmation of placement).
8. Place the stylet in a sharps container and secure site with EZ stabilizer and connect primed EZ-connect extension set to the hub, firmly secure by twisting clockwise.
9. Flush the catheter with 2-3 mL Normal Saline adults; look for infiltration (2nd confirmation of placement).
10. Begin infusion utilizing a pressure delivery system and continue to monitor extremity for complications.
11. Any prehospital fluids or medications approved for intravenous (IV) use may be given IO.
12. Document the procedure, time, and result (success) on/with the patient care report (PCR).

Certification Requirements:
- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- Patient with uncomplicated conducted electrical weapon (Taser®) probes embedded subcutaneously in non-sensitive areas of skin.
- Taser probes are barbed metal projectiles that may embed themselves up to 13 mm into the skin.

Contraindications:

- Patients with conducted electrical weapon (Taser®) probe penetration in vulnerable areas of body as mentioned below should be transported for further evaluation and probe removal.
- Probes embedded in skin above level of clavicles, female breasts, or genitalia.
- Suspicion that probe might be embedded in bone, blood vessel, or other sensitive structure.

Procedure:

1. Ensure wires are disconnected from the weapon.
2. Stabilize skin around probe using non-dominant hand.
4. Remove probe in single quick motion.
5. Wipe wound with antiseptic wipe and apply dressing.
6. Document the procedure, time and result (success) on/with the patient care report (PCR).

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:
- Life threatening extremity hemorrhage that cannot be controlled by other means.
- Serious or life threatening extremity hemorrhage and tactical considerations prevent the use of standard hemorrhage control techniques.

Contraindications:
- Non-extremity hemorrhage.
- Proximal extremity location where tourniquet application is not practical.

Procedure:
1. Expose the extremity by removing clothing in proximity to the injury.
2. Place Combat application tourniquet® (CAT®) directly on the skin, 2-3 inches above the wound.
3. Route the self-adhering band around the extremity.
4. For the upper extremity, the band should be passed through the inside buckle, closest to the fabric, and then pull the band tight. If you place it through the outside slit, away from the fabric, you add a small amount of distance between the band and the buckle that could increase the “pinch” feel. The CAT® is delivered in the one-handed configuration with the band through the inside slit, closest to the fabric, and is the recommended storage configuration. For lower extremity, pass the band through the inside slit (side closest to fabric) and then down through the outside slit (to add additional friction).
5. Pull the self-adhering band as tight as possible prior to trying to twist the windlass rod. This will reduce the number of turns needed to stop blood flow.
6. Twist the rod until bright red bleeding stops and no distal pulse is felt on the extremity.
7. Lock the rod in place with the clip and adhere any remaining band over the rod, inside the clip, and fully around the limb. Secure the rod and band with the white velcro strap on clip.
8. The tourniquet is effectively applied when there is cessation of a distal pulse and bleeding from the injured extremity, indicating total occlusion of arterial blood flow.
9. If hemorrhaging is still not controlled, consider additional tightening of the tourniquet or place a second CAT® side by side and proximal to the first and repeat the placement procedure.
10. Tourniquets should NOT be removed or loosened under prehospital care conditions. Doing so contributes to compartment syndrome.
11. Patient should have an identifying mark or tag indicating “TK” and the time of placement. Document application time on the white writeable tab on the CAT® and on your patient care report (PCR). Communicate time at transfer of care.
12. Document the procedure, time and result (success) on/with the PCR.

Certification Requirements:
- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure.
  Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:
- Adult failed airway.
- Management of an airway when standard airway procedures cannot be performed or have failed in a patient greater than or equal to 12 years old.

Procedure:
1. Have suction and supplies available and ready.
2. Locate the cricothyroid membrane utilizing anatomical landmarks.
3. Prep the skin with an antiseptic solution.
4. Attach a 5 mL syringe to an 18 G - 1 ½ inch needle.
5. Insert the needle (with syringe attached) perpendicularly through the cricothyroid membrane with the needle directed posteriorly.
6. During needle insertion, gentle aspiration should be applied to the syringe. Rapid aspiration of air into the syringe indicates successful entry into the trachea. Do not advance the needle any further. Attach forceps and remove syringe.
7. With the needle remaining in place, make a 1 inch vertical incision through the skin and subcutaneous tissue above and below the needle using a scalpel. Using blunt dissection technique, expose the cricothyroid membrane. This is a bloody procedure. The needle should act as a guide to the cricothyroid membrane.
8. With the needle remaining in place, make a 1 inch vertical incision through the skin and subcutaneous tissue above and below the needle using a scalpel. Using blunt dissection technique, expose the cricothyroid membrane. This is a bloody procedure.
9. Visualize the cricoid membrane through incision.
10. Make a horizontal stabbing incision approximately ½ inch through the membrane.
11. Using (skin hook, tracheal hook, or gloved finger) to maintain surgical opening, insert the cuffed tube into the trachea. (Cric tube from the kit or a 6.0 endotracheal tube (ETT) is usually sufficient).
12. Inflate the cuff with 5-10 mL of air and ventilate the patient while manually stabilizing the tube.
13. All of the standard assessment techniques for insuring tube placement should be performed (auscultation, chest rise & fall, end-tidal CO₂ detector, etc.). Esophageal bulb devices are not accurate with this procedure.
14. Secure the tube to the patient’s face.
15. Document ETT size, time, result (success), and placement location by the centimeter marks. Document all devices used to confirm initial tube placement and after each movement of the patient.
16. Document the procedure, time, and result (success) on/with the patient care report (PCR).
17. It is required that the airway be monitored continuously through waveform capnography and pulse oximetry as soon as available.
18. Complete an airway evaluation form with all intubations.

Certification Requirements:
- THIS PROTOCOL IS FOR THOSE PARAMEDICS EXPRESSLY APPROVED BY MD. LUTZ TO PERFROM THIS SKILL. NO OTHER PARAMEDIC CAN PERFORM THIS SKILL EVEN WITH DIRECTION FROM ON-LINE MEDICAL CONTROL.
- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- Irrigation for eye injuries prior to and during transport.

Irrigation Guidelines and Procedures:

1. For chemical splashes to the eye, emergent irrigation is critical to preventing further tissue damage. If there is no concern for physical trauma to the eye, utilize a Morgan Lens® to immediately provide copious irrigation directly to the globe. Have patient remove contact lenses. Follow the Eye Injury/Complaint Protocol.

2. To utilize the Morgan Lens®, follow these steps:
   a. Apply topical ocular anesthetic (e.g., 2 drops Tetracaine).
   b. Attach Morgan Lens® set to IV tubing to sterile solution (e.g., saline bag); START FLOW.
   c. Have patient look down, retract upper lid, and insert Morgan Lens® under upper lid.
   d. Have patient look up, retract lower lid, and then gently drop lens in place.
   e. Release lower lid over lens and ensure steady, copious flow. Secure tubing to prevent accidental lens removal. Absorb outflow with towels. DO NOT RUN DRY.
   f. Irrigate with at least one liter of sterile solution. For lens removal, ENSURE FLOW OF SOLUTION IS CONTINUING, have patient look up, retract lower lid (and upper lid slightly if necessary), and slide Morgan Lens® out. Stop flow only after removing lens.

3. Document the procedure, including solution and volume used to irrigate, in the patient care report (PCR).

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Clinical Indications:

- Serious hemorrhage that cannot be controlled by other means.

Contraindications:

- Wounds involving open thoracic or abdominal cavities.

Procedure:

1. Apply approved non-heat-generating hemostatic agent per manufacturer’s instructions.
2. Supplement with direct pressure and standard hemorrhage control techniques.
3. Apply dressing.
4. Document the procedure, time and result (success) on/with the patient care report (PCR).

Certification Requirements:

- Maintain knowledge of the indications, contraindications, technique, and possible complications of the procedure. Assessment of this knowledge may be accomplished via quality assurance mechanisms, classroom demonstrations, skills stations, or other mechanisms as deemed appropriate by the Greenville County EMS system.
Universal Patient Care Protocol

- Scene safety
- Bring all necessary equipment to patient’s side
- Demonstrate professionalism and courtesy
- PPE (consider airborne and droplet if indicated)
- Initial assessment
- BLS maneuvers
- Initiate Oxygen if indicated

Minimum Equipment
- ALS bag
- Heart monitor or AED
- Oxygen Caddy

See appropriate protocol

Vital signs (temperature if appropriate)
- Pulse oximetry
- Consider supplemental Oxygen
- Consider glucose measurement
- Consider 12-Lead EKG
- Consider cardiac monitor

Glucose <60 with signs of hypoglycemia

See: AMS/Diabetic Emergency protocol

Patient Definition: A patient is defined as any person who meets any of the following criteria:
- Receives basic or advanced medical/trauma treatment
- Is physically examined
- Has visible signs of injury or illness or has a medical complaint
- Requires EMS assistance to change locations and/or position
- Identified by anyone as a possible patient because of some known, or reasonably suspected illness or injury
- Has a personal medical device evaluated or manipulated by EMS
- Requests EMS assistance with the administration of personal medications or treatments

PEARLS:
- Any patient contact which does not result in an EMS transport must have a completed waiver.
- Required vital signs on every patient include blood pressure, heart rate, respirations, pain/severity.
- Pulse oximetry and temperature documentation is dependent on the specific complaint.
- A pediatric patient is defined by less than 12 years old or less than 55 kg.
- Timing of transport should be based on patient’s clinical condition and the transport policy.
- Appropriate care should be performed where the patient is found, unless the scene is unsafe or rapid transport is indicated (ie: STEMI, CVA, trauma).
- Never hesitate to contact Medical Control for a patient who refuses transport.
- Each patient should have at least one full set of vital signs taken manually and not obtained by the LP12 or LP15. Additionally there should be at least one set of vital signs recorded for every 15 minutes of patient contact time.
- Orthostatic vital sign procedure should be performed in situations where volume status is in question.
**Universal Airway**

**Inadequate effort/rate**

- **F** Nasopharyngeal airway
  - Yes
  - Gag reflex
  - No

- **P** Consider nasotracheal intubation (adult only)
  - Yes
  - See appropriate protocol
  - No

- **B** Insert BIAD
  - Yes
  - Successful
  - No

- **P** Oropharyngeal airway
  - Yes
  - Consider ETT
  - No

**PEARLS:**

- Capnometry (color) or capnography is mandatory with all methods of intubation. Document results.
- Continuous capnography (EtCO₂) should be utilized for the monitoring of all patients with a BIAD or endotracheal tube (ETT).
- For the purpose of this protocol a secure airway is when the patient is receiving appropriate oxygenation and ventilation.
- An intubation attempt is defined as passing the laryngoscope blade or endotracheal tube past the teeth or inserted into the nasal passage.
- Ventilatory rate should be 30 for neonates, 25 for toddlers, 20 for school age, and 6-10 for adolescents and adults. Maintain an EtCO₂ between 35 and 40 and avoid hyperventilation.
- Maintain C-spine immobilization for patients with suspected spinal injury.
- Position patient correctly prior to intubation. Ramp the patient and place patient's face parallel with ceiling in a sniffing position. If patient is on the stretcher (which is the ideal position for intubation), raise the stretcher and elevate the stretcher head.
- Do not assume hyperventilation is psychogenic. Use Oxygen, not a paper bag.
- Hyperventilation in deteriorating head trauma should only be done to maintain an EtCO₂ of 30-35.
- Obese adults (greater than 120 kg) desaturate to 0% in less than 3 minutes. Proceed with RSI cautiously.
- It is important to secure the ETT well and consider c-collar to better maintain ETT placement.
Medication Facilitated Intubation (MFI)

**Indications:**
- Age greater than 12
- Trauma with GCS ≤9 with gag reflex
- Trauma with significant facial trauma and poor airway control
- Closed head injury or major stroke with unconsciousness
- Acute burn with airway involvement and inevitable airway loss
- Respiratory exhaustion such as severe asthma, CHF or COPD with hypoxia
- Overdose with AMS where loss of airway is inevitable

**Difficult Laryngoscopy:**
- Look
- Evaluate: 3-3-2
- Mallampati score
- Obstruction
- Neck mobility

**Difficult BIAD:**
- Restricted opening
- Obstruction
- Distorted airway
- Stiff lungs or c-spine

**Contraindications:**
- Age Less than 12
- Difficulty ventilating patients with BVM
- Anticipated difficult intubation based on physical exam of airway structures or airway history.

**PEARLS:**
- MFI should be utilized for patients with an immediate airway management need but by rendering apneic (paralytics) could be catastrophic for the patient.
- Intubation equipment includes: intubation kit, Bougie®, BVM, suction, BIAD, waveform capnography.
- All appropriate measures must be taken to attempt to increase O2 saturation to greater than or equal to 94 prior to intubation.
- Do not use CPAP on the trauma patient.
- Bradycardia after tube placement is a strong predictor of a misplaced endotracheal tube (ETT).
- An airway evaluation form must be completed on every patient who receives medication facilitated intubation (MFI).

**Etomidate Dosing Chart**

<table>
<thead>
<tr>
<th>Weight</th>
<th>Dose</th>
<th>Volume</th>
</tr>
</thead>
<tbody>
<tr>
<td>Under 100 lbs</td>
<td>&lt; 45 kg</td>
<td>15 mg</td>
</tr>

<td>100-200 lbs</td>
<td>45-91 kg</td>
<td>20 mg</td>
</tr>
<tr>
<td>Over 200 lbs</td>
<td>&gt; 91 kg</td>
<td>30 mg</td>
</tr>
</tbody>
</table>

**Procedure Steps:**

- F Pre-oxygenate with **100% Oxygen via BVM or CPAP** if possible
- F Place at 30⁰ - 45⁰ angle
- F Monitor O2 sat with pulse oximetry
- I Ensure functioning IV access
- P Monitor heart rhythm with EKG
- P Etomidate IV/IO; see Etomidate Dosing Chart
- P Intubate trachea
- P May repeat two times for a total of 3 attempts

**Successful**

**Notify receiving facility or contact Medical Control**
Rapid Sequence Induction (RSI)

**Indications:**
- Age greater than 12
- Trauma with GCS ≤9 with gag reflex
- Trauma with significant facial trauma and poor airway control
- Closed head injury or major stroke with unconsciousness
- Acute burn with airway involvement and inevitable airway loss
- Respiratory exhaustion such as severe asthma, CHF or COPD with hypoxia
- Overdose with AMS where loss of airway is inevitable

**Difficult Laryngoscopy:**
- Look
- Evaluate: 3-3-2
- Mallampati score
- Obstruction
- Neck mobility

**Contraindications:**
- Age less than 12
- Chronic renal failure patients who have not had hemodialysis within the past 24 hours
- Known hyperkalemia
- Known neuromuscular disease such as myasthenia gravis, amyotrophic lateral sclerosis, muscular dystrophy
- Significant burns greater than 4 days old
- Guillain-Barre syndrome
- Patient or family history of malignant hyperthermia

**Pearls:**
- Etomidate is preferred over Ketamine for trauma patients.
- All appropriate measures must be taken to attempt to increase O2 saturation to greater than or equal to 94 prior to intubation.
- Ketamine can cause a heightened sympathetic response that will increase heart rate and blood pressure.
- Do not use CPAP on the trauma patient.
- Waveform capnography and pulse oximetry must be utilized for a minimum of 5 minutes after tube placement prior to the administration of Vecuronium (Norcuron) and is required for intubation verification and ongoing patient monitoring.
- Bradycardia after tube placement is a strong predictor of a misplaced endotracheal tube (ETT).
- An airway evaluation form must be completed on every patient who receives drug assisted intubation (RSI).

Notify receiving facility or contact Medical Control

PEARLS:

- Etiology of hypotension post intubation: Tension pneumothorax, Hyperventilation, Hypovolemia, or shock.
- Ketamine should be used for sedation in the presence of hypotension.
- Waveform capnography and pulse oximetry must be utilized for a minimum of 5 minutes after tube placement prior to the administration of Vecuronium (Norcuron) and is required for intubation verification and ongoing patient monitoring.
- Bradycardia after tube placement is a strong predictor of a misplaced endotracheal tube (ETT).
- It is required that the airway be monitored continuously through waveform capnography and pulse oximetry.
- An airway evaluation form must be completed on every patient who receives advanced airway management
- Confirm airway placement by ED staff prior to moving the patient from EMS stretcher.
**Acute Coronary Syndromes**

**History:**
- Age ≥18
- Past medical history
  - MI
  - Angina
  - Diabetes
  - Post menopausal
- Medications
- Erectile dysfunction medications
- Recent physical exertion
- Palliation/Provocation
- Quality (crampy, constant, sharp, dull, etc.)
- Region/Radiation/Referral
- Severity (1-10)
- Time (Onset/duration/repetition)

**Significant Findings:**
- Chest pain/pres sure/aching/ tightness
- Location
  - Substernal
  - Epigastric
  - Arm
  - Jaw
  - Neck
  - Shoulder
- Radiation of pain
- Palpation/diaphoretic
- Shortness of breath
- Nausea/vomiting
- Dizziness
- Time of onset

**Differential:**
- Trauma/medical
- Angina/MI
- Pericarditis
- Pulmonary embolism
- Asthma/COPD
- Pneumothorax
- Aortic dissection/aneurysm
- GI reflux/hiatal hernia
- Esophageal spasm
- Chest wall injury/pain
- Pleural pain
- OD (cocaine/methamphetamine)

**PEARLS:**
- Avoid Nitroglycerin in any patient who has used erectile dysfunction medication (i.e., Viagra or Levitra within 24 hrs; or Cialis within 36 hrs) due to potential severe hypotension.
- ACS in the presence of other etiology such as CVA or trauma: DO NOT administer Aspirin or Heparin. Contact Medical Control.
- Nitroglycerin may be repeated at 5-min intervals until pain is relieved (no maximum as long as systolic blood pressure stays above 90).
- Systolic blood pressure must be greater than 90 for Nitroglycerin administration.
- Nitroglycerin may be administered without an IV as long as systolic blood pressure is greater than 100 and there is no evidence of an inferior wall MI.
- Perform a right sided 12-Lead if the patient has an identified inferior MI, or if a right ventricular MI is suspected.
- If the patient has a suspected right ventricular infarct, Nitroglycerin may be administered in stable patients (blood pressure greater than 120) and after an IV of Normal Saline is established; INT is not acceptable (understanding that a significant blood pressure drop may occur with nitrate administration).
- Consider Nitroglycerin Paste, 1 gram/1 inch, after 3 SL Nitroglycerin have been administered. Check blood pressure every 5 min.
- Zofran (Ondansetron) can cause QRS widening.
- STEMI protocol is for patients older than 18 years old; if under 18 year old, contact Medical Control.
- A STEMI cannot be called in the presence of a paced rhythm or a LBBB unless the LBBB is new.
- STEMI’s typically don’t go fast. Consider alternative causes if the heart rate is greater than or equal to 120 beats per minute.
- Patients with STEMI’s should be transported to a PCI capable hospital. Place defib pads on patient and place in a gown if time permits.
- Diabetics and geriatric patients often have atypical pain (i.e., back pain) or only generalized complaints when having a STEMI.
- Patients short of breath should be administered high flow Oxygen regardless of O2 saturation.

---

**Flowchart:**

1. **Oxygen** to maintain an O2 sat of 94%-99%
2. **12-Lead EKG** (within 5 min of arrival); transmit questionable 12-Leads for physician interpretation
   - **Aspirin 324 mg PO**
   - **Initiate IV**
   - **Nitroglycerin 0.4 mg SL; repeat every 5 min**
   - **Consider Nitroglycerin Paste 1 gram/1 inch**
   - **Consider Zofran (Ondansetron) 4 mg IV/IM; may repeat once**
3. **If SBP >90 consider Morphine 2 mg IV increments for pain relief; Max 10 mg**
4. **Transport with early notification:**
   - **scene time <15 min**
   - **Consider Normal Saline up to 1,000 mL for inferior MI's/hypotension**
   - **Consider 2nd IV en-route**
   - **Heparin 5,000 units IV**

---

**Signage:**

- Notify receiving facility or contact Medical Control and give full oral report including updates since 12-Lead transmission.

---

**current as of October 2018 Dr. Martin Lutz, Medical Director – Greenville County EMS**
Bradycardia

**History:**
- Past medical history
- Medications
  - Beta blockers
  - Clonidine
  - Calcium channel blockers
  - Digoxin
- Pacemaker

**Significant findings:**
- HR <60
- Acute CHF
- Seizures
- Chest pain
- Respiratory distress
- Hypotension or shock secondary to bradycardia
- Acute altered mental status
- Syncope

**Differential:**
- Acute MI
- Hypoxia
- Pacemaker failure
- Hypothermia
- Athletes
- Head injury (elevated ICP)
- Stroke
- Spinal cord lesion
- AV blocks (1st⁰, 2nd⁰, or 3rd⁰)
- Overdose

<table>
<thead>
<tr>
<th>F</th>
<th>Oxygen</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>Initiate IV/IO</td>
</tr>
</tbody>
</table>

**PEARLS:**
- If bradycardic patient is also a STEMI, follow the STEMI guidelines.
- For transcutaneous pacing set rate for 70 beats per minute. Increase current (mA) until electrical and mechanical capture occur or pacing current reaches (200 mA).
- For Conscious sedation, see Sedation/Anxiety protocol. Dose should be titrated to provide comfort without causing unconsciousness or respiratory failure. Be sure to monitor patient’s breathing/ventilations, blood pressure and O2 saturation.
- Pacing can be considered first for critical patients in the presence of 2nd⁰ or 3rd⁰ heart block.
- Consider Glucagon (Glucagen) 2 mg IV/IO if patient is still bradycardic and on beta blockers.
- Consider Calcium Gluconate (Kalcinate) 5-20 mL IV/IO if patient is still bradycardic and on calcium channel blockers.
- The use of Lidocaine (Xylocaine), Amiodarone (Cordarone) and calcium channel blockers in heart block can worsen bradycardia and lead to death.
- In wide complex slow rhythm, consider hyperkalemia.
- Push Dose Epi: Mix 1 ml of Epi 1:10,000 with 9 ml NS yields Epi 1,100,000: 10 mcg/ml. Admin 1-2 ml (10-20 mcg) every 10-15 minutes for hypotension.

**Signs and symptoms of poor perfusion caused by the bradycardia:**
- acute AMS
- syncope
- ongoing chest pain
- SOB
- hypotension
- acute CHF
- seizure
- other signs of shock

**HR <60 with signs or symptoms of poor perfusion caused by the bradycardia:**

- Yes
  - Atropine 0.5 mg IV/IO may repeat every 3-5 min max 3 mg
  - Transcutaneous pacing
  - Consider conscious sedation
  - Consider Push Dose Epi 10-20 mcg (1-2 ml) every 10-15 min
- No
  - Continue to monitor and
  - Notify receiving facility or contact Medical Control

**Current as of October, 2018 Dr. Martin Lutz, Medical Director – Greenville County EMS**
**CHF/Pulmonary Edema**

**History:**
- CHF
- Past medical history
- Medications (Digoxin, Lasix)
- Erectile dysfunction medication
- Cardiac history (MI)

**Significant findings:**
- Severe SOB
- Diaphoresis
- Tachycardia
- Elevated blood pressure
- Peripheral edema
- Pink, frothy sputum
- Bi-lateral rales

**CHF vs Differential:**
- MI
- COPD
- Anaphylaxis
- Aspiration
- Pleural effusion
- Pericardial tamponade
- Toxic exposure

---

**Consider Acute Coronary Syndromes Protocol**

Assess symptom severity
Allow patient to maintain a position of comfort (usually sitting)

**MILD:**
- Normal HR
- Elevated or normal BP

- Nitroglycerin 0.4 mg SL; may repeat every 5 min

- Improving

**MODERATE/SEVERE:**
- Elevated HR
- Elevated BP

- Nitroglycerin 0.4 mg SL; may repeat every 5 min

- Apply CPAP

- Consider conscious sedation

**CARDIOGENIC SHOCK:**
- Bradycardia
- Hypotension

- Atropine 0.5 mg IV; may repeat every 3-5 min; max 3 mg

- Transcutaneous pacing

- Consider Push dose Epi 10-20 mcg (1-2 ml) q10-15 minutes

---

**PEARLS:**
- Withhold Nitroglycerin in any patient who has used an erectile dysfunction medication in the past 24 hours.
- For administration of Nitroglycerin, systolic blood pressure must be greater than 90. May be repeated at 5 minute intervals if dyspnea is not relieved and systolic blood pressure remains greater than 90.
- Nitroglycerin may be administered without an IV as long as systolic blood pressure is greater than 100 and there is no evidence of an inferior wall MI.
- For Conscious sedation, see Sedation/Anxiety protocol. Dose should be titrated to provide comfort without causing unconsciousness or respiratory failure. Be sure to monitor patient’s breathing/ventilations, blood pressure and O2 saturation.
- Once CPAP is in use, apply 1 inch Nitroglycerin Paste.
- Nitroglycerin Paste is applied to upper chest and further doses of sublingual Nitroglycerin can be withheld. Remove paste and wipe chest clean if systolic blood pressure is less than 90.
- Push Dose Epi: Mix 1 ml of 1:10,000 Epi into 9 ml Normal Saline: gives Epi 1:100,000; Admin 1-2 ml (10-20 mcg) every 10-15 minutes

---

**Notify receiving facility or contact Medical Control**
Narrow Complex Tachycardia (QRS <0.12)

**History:**
- Medications
  - Aminophylline
  - Diet pills
  - Thyroid supplements
  - Decongestants
  - Digoxin
- Diet (caffeine/chocolate)
- Drugs (nicotine/cocaine)
- Past medical history
- History of palpitation/heart racing
- Syncope/near syncope

**Significant findings:**
- Heart rate >150
- Systolic BP <90
- Dizziness
- Diaphoresis
- Chest pain
- CHF
- SOB
- AMS
- Syncope/near syncope

**Differential:**
- Hypoxia
- Fever
- Sepsis• Dehydration
- Sick sinus syndrome
- Myocardial infarction
- Electrolyte imbalance
- Exertion/pain/emotional stress
- Hypovolemia/anemia
- Drugs/medications (see History)
- Hyperthyroidism
- Pulmonary embolus
- Heart disease (WPW, valvular)

**Potential presenting rhythm:**
- Atrial/sinus tachycardia
- Atrial fibrillation/flutter
- Multifocal atrial tachycardia

**Differential:**
- Hypoxia
- Fever
- Sepsis• Dehydration
- Sick sinus syndrome
- Myocardial infarction
- Electrolyte imbalance
- Exertion/pain/emotional stress
- Hypovolemia/anemia
- Drugs/medications (see History)
- Hyperthyroidism
- Pulmonary embolus
- Heart disease (WPW, valvular)

**PEARLS:**
- Symptomatic tachycardia usually occurs at rates of 120-150 and are typically greater than or equal to 150 beats per minute. Symptomatic patients with heart rates less than 150 likely have impaired cardiac function such as CHF.
- Diltiazem (Cardizem) dose may be mixed in a 50 mL bag of Normal Saline or D5w and infused over 2 minutes for more controlled administration.
- Typical sinus tachycardia is in the range of 100 to (220 minus patient’s age) beats per minute.
- Serious signs/symptoms: hypotension, acutely altered mental status, signs of shock/poor perfusion, chest pain with evidence of STEMI or T-wave inversions or depressions, acute CHF.
- If the patient has a history of WPW or 12-Lead EKG reveals WPW, DO NOT administer a calcium channel blocker (e.g., Diltiazem (Cardizem)) or a beta blocker.
- Avoid carotid sinus massage in patients over 50 years old or with a history of prior neurological event.
- For A-fib/A-flutter, consider administering Diltiazem (Cardizem) prior to administration of Adenosine (Adenocard).
- For Conscious sedation, see Sedation/Anxiety protocol. Dose should be titrated to provide comfort without causing respiratory failure. Be sure to monitor patient’s breathing/ventilations, blood pressure and O2 saturation.
- Monitor for hypotension after administration of calcium channel blocker (i.e., Diltiazem (Cardizem)).
- Document all rhythm changes and therapeutic interventions with monitor strips.
- WPW should be treated with cardioversion or Amiodarone (Cordarone).
**History:**
- Past medical history (CHF)
- Medications
  - Aminophylline
  - Diet pills
  - Thyroid supplements
  - Decongestants
  - Digoxin
- Diet (caffeine/chocolate)
- Drugs (nicotine/cocaine)
- History of palpitation/heart racing
- Syncope/near syncope
- Allergies (Lidocaine/Novocaine)

**Significant findings:**
- Ventricular tachycardia on EKG (runs/sustained)
- Chest pain
- Diaphoresis
- Dizziness
- SOB
- Heart rate usually 150-180 for sustained V-tach
- QRS >0.12

**Differential:**
- Artifact/device failure
- Cardiac
- Endocrine/metabolic
- Drugs
- Pulmonary

---

**Sustained Ventricular Tachycardia (QRS >0.12)**

**PEARLS:**
- Stable ventricular tachycardia is defined as a hemodynamically stable patient in ventricular tachycardia without signs or symptoms of poor perfusion.
- Wide and fast = V-tach. Diltiazem (Cardizem) can cause V-fib in the V-tach patient.
- For Conscious sedation, see Sedation/Anxiety protocol. Dose should be titrated to provide comfort without causing respiratory failure. Be sure to monitor patient’s breathing/ventilations, blood pressure and O2 saturation.
- Administer Amiodarone (Cordarone) infusion at 1 mg/min after successful conversion of V-tach.
- 150 mg infusion over 10 minutes: Add 150 mg of Amiodarone (Cordarone) to a 50 mL bag of Normal Saline and administer through a 10 gtt set at 50 drops per minute.
- 1 mg/min infusion: Add 150 mg Amiodarone (Cordarone) to a 50 mL bag of Normal Saline and administer through a 60 gtt set at 20 drops per minute.
- If torsades de pointes administer Magnesium Sulfate 1-2 grams/2-4 mL slow IV push over 2 minutes.
- WPW should be treated with cardioversion or Amiodarone (Cordarone).
- If the patient is receiving shocks from an automated internal cardiac defibrillator (AICD) and the device is shocking appropriately, utilize medications and cardioversion as if the device was not present after the second shock delivered by the AICD. It is important to place the pads a minimum of 3 inches away from the AICD. If the device is malfunctioning and shocking is not appropriate, utilize Conscious Sedation see Sedation/Anxiety protocol. Dose should be titrated to provide comfort without causing respiratory failure. Be sure to monitor patient’s breathing/ventilations, blood pressure and O2 saturation.
Medical Cardiac Arrest

**History:**
- Past medical history
- Medications
- Events leading to arrest
- End stage renal disease
- Estimated downtime
- Suspected hypothermia
- Suspected overdose
- DNR form or living will

**Significant Findings:**
- Unresponsive
- Pulseless
- Apneic
- No electrical activity on EKG
- Ventricular fibrillation/ventricular tachycardia
- No auscultated heart tones

**Differential:**
- Medical/trauma
- Hypoxia/pulmonary
- Potassium (hypo/hyper)
- Drug overdose
- Acidosis
- Hypothermia
- Device error/artifact

**Withhold Resuscitation:**
- Rigor mortis and/or dependent lividity
- Body decomposition
- Asystole with extended/unknown down time
- Decapitation
- Incineration

**Criteria for Death/DNR**

**PEARLS:**
- CPR 100-120 compressions per minute and at a depth of no less than 2 inches with interruptions less than 5 seconds.
- Monitor in paddles mode with metronome on.
- Consider Calcium Gluconate (Kalcitrate) 10-20 mL IV, followed by Normal Saline 100 mL IV and Sodium Bicarbonate 1 mEq/kg IV in hemodialysis patient early in the resuscitation.
- If patient is receiving shocks from an automated internal cardiac defibrillator (AICD), wait 30-60 seconds after the internal shock to analyze the rhythm and then treat the patient as if the AICD was not present. Placement of the defibrillator pads should be approximately 3 inches away from the device if possible. Posterior/anterior placement is acceptable.
- If patient is in torsades de pointes, administer Magnesium Sulfate 2 grams/4 mL slow IV push over 2 minutes.
- Always confirm asystole in more than one lead.
- Only move the patient enough to make adequate room to work.
- All resuscitations initiated at the jail must be transported.
- Consider transport with persistent V-fib.
- Assign a team resuscitation leader and utilize checklist.
- Reassess and document endotracheal tube placement and EtCO₂ frequently, after every move, and at transfer of care.

**Contact Medical Control or Coroner**

**Defibrillate 200 joules, 300 joules, 360 joules; all subsequent shocks at 360 joules**

**Epinephrine 1 mg IV/IO; repeat every 3-5 min**

**Amiodarone (Cordarone) 300 mg IV/IO; repeat once at 150 mg**

**Place 2nd IV/IO when feasible**

**Return of spontaneous circulation**

**Consider Discontinuation of Prehospital Resuscitation Policy**

**See: Post Resuscitation protocol**
**PEARLS:**
- **Ensuring high quality compressions with minimal interruptions takes priority.**
- Adequate compressions with timely defibrillation are the keys to success.
- **Monitor in paddles mode with metronome on.**
- **Do not hyperventilate!** If advanced airway is not established, compression to breath ratio should be 30:2 for adult or 15:2 for child. Once advanced airway is in place, ventilate at a rate of 8-10 breaths per minute.
- Each breath should be administered over 1 second with just enough air to notice chest rise.
- Provide compressions while monitor/AED is charging.
- Keep all breaks in compressions to less than 5 seconds.
- Consider possible **CAUSE** of arrest early: For example, resuscitated V-fib may be a STEMI and more rapid transport is indicated. Consider traditional ACLS “H’s and T’s” for PEA: **Hypovolemia, Hypoxia, Hydrogen ions (acidosis), Hyperkalemia, Hypothermia, Hypo/Hyperglycemia, Tablets/Toxins/Tricyclics, Tamponade, Tension pneumothorax, Thrombosis (MI), Thromboembolism (Pulmonary Embolism), Trauma.**
- When considering **CAUSE,** consider utilizing relevant protocols in conjunction: airway, all cardiac protocols, allergic reaction, AMS/diabetic, Poisoning/overdose, suspected stroke, etc..
- **Maternal Arrest** - Treat mother per appropriate protocol with immediate notification to Medical Control and rapid transport.

---

**Cardiopulmonary Resuscitation (CPR) Team-Based Approach**

**FIRST CREW ON SCENE**

<table>
<thead>
<tr>
<th>FIRST RESCUER</th>
<th>Second Rescuer</th>

<th>All Crews</th>
</tr>
</thead>
<tbody>
<tr>
<td>Begin continuous CPR compressions; push hard (adult: &gt;2 inches; child: &gt;1½ inches) push fast (100-120/min); change compressors every 2 min (limit changes/pulse checks to &lt;5 sec) during entire arrest</td>
<td>Attach AED/monitor and defibrillate as necessary; provide ventilations with BVM</td>
<td>Assumes airway; consider BIAD/intubation; compressions should not be stopped to intubate; place resQpod</td>
<td>Establish Team Leader/Code Commander: Utilize Cardiac Arrest Checklist</td>
<td>Initiate IV/IO and administer appropriate medications at request of code commander</td>
<td>Follow appropriate arrest protocols</td>
</tr>
<tr>
<td>FIRST/SECOND OR THIRD RESCUER</td>
<td>Once advanced airway is in place, ventilate every 6-8 sec; DO NOT interrupt compressions except for changes/pulse checks</td>
<td>Continue cardiac arrest protocol</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**CODE COMMANDER**

- Responsible for patient care
- Ensures high quality compressions
- Ensures frequent compressor changes
- Responsible for communication with family
- Operates monitor; utilizes the event button
- Measures medications and gives to 5th rescuer at time of administration

---

**Adult Cardiac Arrest**

Current as of October 2018 Dr. Martin Lutz, Medical Director – Greenville County EMS
Cardiopulmonary Resuscitation (CPR) Team-Based Approach

First Rescuer (BLS)
- Assess patient; start CPR
- Alternate 240 compressions with Second Rescuer
- Ventilate on off cycle every 30 compressions

Second Rescuer (BLS)
- Attach monitor/defib pads
- Alternate 240 compressions with First Rescuer
- Ventilate on off cycle every 30 compressions

Third Rescuer (ALS)
- Place advanced airway
- Ventilate 8-10 bpm
- Place resQpod

Fourth Rescuer (Code Commander)
- Operates monitor
- Consider treatable causes
- Utilize arrest checklist
- Measures medications for 5th rescuer

Fifth Rescuer (ALS)
- Initiate IV/IO
- Administer medications

Adult Cardiac Arrest
Deceased Person

History:
- Person encountered by EMS who meets criteria for obvious death
- Patient with a valid DNR who is pulseless and apneic
- Patient with other approved advanced directive requiring no CPR be administered who is pulseless and apneic
- Patient for whom resuscitative efforts are ceased on scene
- Name of primary care physician
- Known medical conditions
- Last time known to be alive
- Fetal death

Definitions:
- Natural death scenes: scenes where there is reasonable evidence that the person died of natural causes (i.e., illness, old age, etc.)
- Unnatural or questionable death scenes: scenes outside the definition of a natural death (i.e., violence, trauma, drugs or drug paraphernalia, hemorrhage, fetal death and/or products of conception, pediatrics, questionable or insufficient information to identify cause of death, patients <60 years old without an extensive medical history, etc.)
- High morbidity cases: cases in which EMS personnel believe that patient death may be imminent as a result of unnatural causes (i.e., fetal death, pediatric cardiac arrests, trauma with RTS <6, priority one trauma, high percentage burn, high voltage electrocution, drowning, etc.)

PEARLS:
- If at any time there is a question as to the death scene being a questionable scene, stop inspection and secure the scene immediately and notify the Coroner’s office.
- For all high morbidity cases contact the Coroner.
- Contact the patient’s primary care physician to certify death and sign the death certificate.
- Greenville County Paramedics may declare a person dead on the scene or during EMS transport. Paramedics are expected to use reasonable judgment, coupled with compassion, when declaring death and/or interacting with the public and other agencies.
- Fetal death includes abortion, still birth, miscarriage, and products of conception, etc.
- In the case of natural death, contact the patient’s primary care physician to certify death and sign the death certificate. It is acceptable to transfer information through a nurse or other licensed personnel at the physician’s office if the physician is unable to come to the phone to certify the death.
- If a physician cannot be contacted or is unwilling to sign the death certificate, notify the Coroner.
- Do not re-enter the scene or immediate area of the scene during the investigation unless requested to do so by the Coroner on-scene.
- Leave in place any and all disposable medical equipment used to assess and/or treat the patient (i.e. monitor pads, inserted airways and IV setups, etc.) until the patient is released by the Coroner.
- When determining death, use caution and move the patient and/or articles (i.e., furniture, etc.) as little as necessary to accomplish the task at hand.
- Patients can be covered if the scene is in view of the public.

Decision Tree:
- Continue with resuscitation per appropriate protocol
- Patient meets criteria for discontinuation or has injuries incompatible with life
  - Natural death scene
    - Contact primary care physician
    - Contact Coroner
  - Unnatural, questionable or traumatic death scene
    - Contact Coroner and law enforcement
    - Leave the immediate area without disturbing anything related to the scene
      - Do not move or reposition the body after initial assessment
      - Secure the scene as much as practical
    - Patient released by Coroner
      - Contact funeral home
History:
- Respiratory arrest
- Cardiac arrest

Significant Findings:
- Return of pulse

Differential:
- Continue to address specific differentials associated with the original dysrhythmia

**F**
Continue ventilatory support; **100% Oxygen**; EtCO2 ideally >20; RR <12;

**B**
12-Lead EKG

**I**
Place 2nd IV/IO

---

**Termination of ventricular rhythm**

**Yes**

**Sustained Pulse**

**No**

**Hypotension**

**I**
Consider **Normal Saline 500 mL IV/IO**

**P**
If still hypotensive after fluid bolus, consider **Push Dose Epi 10-20 mcg (1-2 ml) q10-15 minutes**

**STEMI**

**P**
Heparin 5,000 units IV/IO and call aSTEMI alert

**Bradycardia**

**P**
Consider **Atropine 0.5 mg IV/IO**; may repeat every 3-5 min; max 3 mg

**Consider transcutaneous pacing**

**Consider Push Dose Epi 10-20 mcg (1-2 ml) q10-15 minutes**

---

**Notify receiving facility or contact Medical Control**

**PEARLS:**
- Rule out pulmonary edema before administration of **Normal Saline** bolus to a hypotensive patient.
- If patient remains hypotensive after initial **500 mL Normal Saline**, administer an additional 500 mL; total **1,000 mL**.
- If **Push Dose Epi** is not effective call Medical Control.
- **Push Dose Epi**: Mix 1 ml of 1:10,000 Epi in 9 ml NS, results in 1:100,000 (10 mcg/ml) admin 10-20 mcg (1-2 ml) q 10-15 minutes for hypotension.
- For **transcutaneous pacing** set rate for 70 beats per minute. Increase current (mA) until electrical and mechanical capture occur or pacing current reaches (200 mA).
- **Amiodarone (Cordarone)** is not a primary post-arrest medication unless significant ectopy is present.
- **150 mg infusion over 10 minutes**: Add **150 mg Amiodarone (Cordarone)** to a **50 mL bag Normal Saline** and administer through a 10 gtt set at 50 drops per minute
- **1 mg/min infusion**: Add **150 mg Amiodarone (Cordarone)** to a **50 mL bag Normal Saline** and administer through a 60 gtt set at 20 drops per minute.
- Transport to a PCI capable hospital.

Current as of October, 2018 Dr. Martin Lutz, Medical Director – Greenville County EMS
Abdominal Pain

History:
- Age
- Past medical/surgical history
- Medications
- Onset
- Palliation/Provocation
- Quality (crampy/constant/ sharp/dull/ etc.)
- Region/Radiation/Referred
- Severity (1-10)
- Time (duration/repetition)
- Fever
- Last meal eaten
- Last bowel movement/emesis
- Menstrual history (pregnancy)

Significant Findings:
- Pain (location/migration)
- Tenderness
- Nausea
- Vomiting
- Diarrhea
- Dysuria
- Constipation
- Vaginal bleeding/discharge

Pregnancy associated symptoms (Helpful to localize source)
- Fever
- Myalgias
- Headache
- Cough
- Weakness
- Headache
- Rash
- Mental status changes

Differential:
- Pneumonia or pulmonary embolus
- Liver (hepatitis/CHF)
- Peptic ulcer disease/gastritis
- Gallbladder
- Myocardial infarction
- Pancreatitis
- Kidney stone
- Abdominal aneurysm
- Appendicitis
- Bladder/prostate disorder
- Pelvic (PID/ectopic pregnancy/ ovarian cyst)
- Spleen enlargement
- Diverticulitis
- Bowel obstruction
- Gastroenteritis (infectious)

PEARLS:
- A 12-Lead will be performed on all patients over the age of 50 with a complaint of pain or discomfort above the navel, non-traumatic back pain, shortness of breath, and/or syncope.
- Abdominal pain in women of childbearing age should be treated as an ectopic pregnancy until proven otherwise.
- Antacids should be avoided in patients with renal disease.
- The diagnosis of abdominal aneurysm should be considered with abdominal pain in patients over 50.
- Repeat vital signs after each bolus.
- Appendicitis may present with vague, peri-umbilical pain which migrates to the RLQ over time.
- Appendicitis may present with rebound tenderness and abdominal guarding.
- Age based hypotension:
  - less than 1 year: less than 70
  - 1-10 years: less than 70 + (2 x age)
  - greater than 11: less than 90 + (2 x age)

Oxygen
Orthostatic blood pressure
Initiate IV

Hypotension with signs of poor perfusion

Nausea and/or vomiting

 Notify receiving facility or contact Medical Control

Right Upper Quadrant (RUQ):
- Liver (Majority)
- Right Kidney
- Colon
- Pancreas (small portion)
- Gallbladder
- Small intestine

Right Lower Quadrant (RLQ):
- Colon
- Small intestines
- Right ureter
- Appendix
- Right Ovary (Female)
- Right Fallopian tube

Left Upper Quadrant (LUQ):
- Liver (small portion)
- Spleen
- Left Kidney
- Stomach
- Colon
- Pancreas (Majority)
- Small intestine

Light Lower Quadrant (LLQ):
- Colon
- Small intestines
- Right ureter

8.1
Altered Mental Status/Diabetic Emergencies

**History:**
- Known diabetic; medical alert tag
- Report of illicit drug use or toxic ingestion
- Past medical history
- Medications
- History of trauma
- Change in condition
- Changes in feeding or sleeping habits

**Significant Findings:**
- Decreased mental status or lethargy
- Change in baseline mental status
- Bizarre behavior
- Hypoglycemia (cool, diaphoretic skin)
- Hyperglycemia (warm, dry skin, fruity breath, Kussmaul respirations; rapid, deep breathing, signs of dehydration)
- Irritability

**Differential:**
- Head trauma
- CNS (stroke/tumor/seizure/infection)
- Cardiac (MI/CHF)
- Hypothermia/hyperthermia
- Infection (CNS and other)
- Thyroid (hyper/hypo)
- Shock
- Diabetes (hyper/hypoglycemia)
- Toxic ingestion
- Acidosis/alkalosis
- Environmental exposure
- Pulmonary (hypoxia)
- Electrolyte abnormality
- Psychiatric disorder

---

### PEARLS:

- Low glucose (less than 60), normal glucose (60-120), high glucose (greater than 250).
- Pay careful attention to the head exam for signs of bruising or other injury.
- While infusing **10% Dextrose (D10) solution**, monitor the patient for changes in level of consciousness and signs/symptoms of CHF/pulmonary edema.
- It is safer to assume hypoglycemia than hyperglycemia if doubt exists. Re-check blood glucose after administration of Dextrose or Glucagon (GlucaGen).
- Be aware of altered mental status as a presenting sign of an environmental toxin or Haz-Mat exposure and protect personal safety.
- Do not let alcohol confuse the clinical picture. Alcoholics frequently develop hypoglycemia and may have unrecognized injuries.
- Consider restraints if necessary for patient's and/or personnel's protection per the Behavioral Emergencies/Chemical Restraint Protocol.
- **50% Dextrose (D50)** can be given on a case by case basis per Paramedic discretion.
Anaphylactic Shock/Allergic Reaction

**History:**
- Onset and location
- Insect sting/bite
- Food allergy/exposure
- Medication allergy/exposure
- New clothing, soap, detergent
- Past history of reactions
- Past medical history
- Medication history
  - **Antipsychotics**
  - **Antiemetics**
  - **Ace inhibitors**

**Significant Findings:**
- Itching/hives
- Respiratory distress
- Chest/throat constriction
- Difficulty swallowing
- Hypotension/shock
- Nausea
- Vomiting

**Differential:**
- Urticaria (rash only)
- Anaphylaxis (systemic effect)
- Shock (vascular effect)
- Angioedema (drug induced)
- Aspiration/airway obstruction
- Vasovagal event
- Asthma
- COPD
- CHF

---

**PEARLS:**
- If the patient is hemodynamically unstable, refractory to IM Epi. and IV Fluids request an order of Epinephrine 1:10,000 0.5 - 1mL/0.05 - 0.1 mg.
- Ace inhibitors can cause isolated angioedema (i.e., lip swelling without airway involvement). Common ace inhibitors include Zestril (Lisinopril), Tritace (Ramipril), Renitec (Enalapril), Vasostad (Captopril), Cibacen (Benazepril).
- Methylprednisolone (Solumedrol) 125 mg IV may be administered for isolated angioedema caused by Ace inhibitors.

---

**Immediate** begin rapid treatment if any of the following S/S are present.
- Itching/hives
- Respiratory distress
- Chest/throat constriction
- Difficulty swallowing
- Hypotension/shock
- Nausea
- Vomiting

**Oxygen**

**12-Lead EKG**

**Initiate IV**

**Diphenhydramine (Benadryl) 50 mg IM or 25 mg IV**

**Epinephrine 1:1,000 0.5 mg IM; may be repeated every 15 min; max 4 doses**

**Normal Saline up to 1,000 mL IV to reduce signs of hypotension**

**Methylprednisolone (Solumedrol) 125 mg IV**

**Respiratory distress**
- No
- Yes

**Albuterol (Ventolin) 5 mg via nebulizer**

**Notify receiving facility or contact Medical Control**
Dystonic Reaction

**History:**
- Medication allergy/exposure
- Past history of reactions
- Past medical history
- Medication history
  - Antipsychotics
  - Antiemetics
  - Ace inhibitors

**Significant Findings:**
- Involuntary muscle contractions of the face, chest, neck, back, and pelvis
- Deviated pupils
- Swollen tongue

**Differential:**
- Acute Extrapyramidal reaction
- Akathisia

---

**Do not use this order if chest pain is thought to be cardiac in origin**

See PEARLS

| P | Ativan 1-2 mg IV/IO; may repeat to a max of 4 mg |
| I | Normal Saline up to 1,000 mL IV to reduce signs of hypotension |

**PEARLS:**
- Common medication groups that cause dystonic reactions include *antipsychotics*: Zyprexa (Olanzapine), Haloperidol (Haldol), Alprazolam (Xanax), Fluphenazine (Prolixin), Thorazine (Chlorpromazine), Ziprasidone (Geodon) and *antiemetics*: Compazine (Prochlorperazine), Promethazine (Phenergan), Hydroxyzine (Vistaril), Metoclopramide (Reglan).
- Patients hemodynamically unstable refractory to IV fluids request an order for EPI 1-10,000 0.5 - 1 mL/0.05-0.1mg
- Wait 10-15 minutes after Benadryl before administering Ativan.

---

Notify receiving facility or contact Medical Control
Behavioral Emergencies/Chemical Restraint

History:
- Situational crisis
- Psychiatric illness
- Medications
- Injury to self or threat to others
- Medical alert tag
- Substance abuse/overdose
- Diabetes

Significant Findings:
- Anxiety/agitation/confusion
- Affect change/hallucinations
- Delusional thoughts/bizarre behavior
- Combative
- Expression of suicidal/homicidal thoughts

Differential:
- See AMS differential
- Alcohol intoxication
- Toxin/substance abuse
- Medication effect/overdose
- Withdrawal syndromes
- Depression
- Bipolar (manic-depressive)
- Schizophrenia
- Anxiety disorders

PEARLS:
- Use this protocol for those patients with a psycho-social condition, including drug intoxication, exhibiting extreme anxiety and who are hemodynamically stable. Not indicated for acute psychosis.
- Be sure to consider all possible medical/trauma causes or behavior (hypoglycemia, overdose, substance abuse, hypoxia, head injury, etc.).
- Withhold Ketamine in patients 65 or older. Administer Midazolam 5mg IM; if further sedation is needed contact online medical control.
- Ketamine dosing in this protocol will cause disassociation and unconsciousness even though patient will appear awake.
- Do not overlook the possibility of associated domestic violence or child abuse.
- Any patient who is handcuffed or restrained by law enforcement and transported by EMS must be accompanied by law enforcement in the ambulance.
- Do not position or transport any restrained patient in such a way that could impact the patient’s respiratory or circulatory status. Never hog-tie or restrain in a prone position with hands tied behind back. No restraint shall ever be tied around the head, neck or chest, nor shall pressure be applied to these areas in an attempt to restrain or control the patient.
- EMS providers may use physical and/or chemical restraints on patients who pose a danger to themselves or others. Use the minimum amount of restraint necessary.
- Physical restraints must be soft in nature and pose no threat to the patient’s safety. Only the extremities shall be restrained and these restraints must be assessed every five minutes. Stretcher straps are not considered restraints.
- A surgical or oxygen mask may be placed loosely on the patient to prevent spitting.
- Continuously monitor EKG and O2 sat once the level of patient agitation allows.

Injections >5ml should be split over two separate syringes
Eclampsia/Pre-eclampsia

**History:**
- Past medical history
- Hypertension medications
- Prenatal care
- Prior pregnancies/births
- Gravida/para

**Significant Findings:**
- Vaginal bleeding
- Abdominal pain
- Hypertension
- Severe headache
- Blurred vision
- Edema of hands and face
- Seizures
- Dizziness
- Confusion
- Nausea/Vomiting

**Differential:**
- Preeclampsia/eclampsia
- Placenta previa (placenta covers cervical opening)
- Placenta abruptio (separation of placenta from uterine wall)
- Spontaneous abortion
- Ectopic pregnancy

**PEARLS:**
- Typically seen after the 20th week of pregnancy.
- If IV is unobtainable Magnesium Sulfate can be administered IM. Administer 4 grams/8 mL in each dorsogluteal muscle (upper buttock) for a total of 8 grams/16 mL (5 mL max for each site). Multiple sites are necessary.
- Magnesium Sulfate can cause hypotension and respiratory depression; be prepared to aggressively manage the patient’s airway and blood pressure.
- If Midazolam (Versed) is unavailable, consider Lorazepam (Ativan) 1-4 mg slow IV push or Diazepam (Valium) 1-10 mg IV.
- In the setting of pregnancy, hypertension is defined as a systolic blood pressure greater than 160 or diastolic blood pressure greater than 90, or a relative increase of 30 systolic and 20 diastolic from the patient’s normal (pre-pregnancy) blood pressure.
- Placenta abruptio usually occurs after 20 weeks gestation. S/S: painful 3rd trimester dark red vaginal bleeding, hypotension, tachycardia.
- Placenta previa can occur during 2nd and 3rd trimester. S/S: painless bright red vaginal bleeding, possible hypotension, tachycardia.
- Physiologic changes during pregnancy: Tachycardia, tachypnea, T wave changes in II, avF, avL
Hypertensive Crisis/Urgency

**History:**
- Documented hypertension
- Pregnancy
- Medications (compliance?)
- Related diseases
  - Diabetes
  - CVA
  - Renal failure
  - Cardiac
- Erectile dysfunction medication
  - Levitra
  - Cialis
  - Viagra

**Significant Findings:**
One of these
- Systolic BP ≥220
- Diastolic BP ≥120
AND at least one of these
- Headache
- Nosebleed
- Blurred vision
- Dizziness

**Differential:**
- Hypertensive encephalopathy
- Primary CNS injury
  - Cushing's response (bradycardia with hypertension)
- Myocardial infarction
- Aortic dissection/aneurysm
- Eclampsia/pre-eclampsia

---

**PEARLS:**
- Never treat elevated blood pressure based on one set of vital signs or on vital signs alone.
- Check blood pressure in both arms.
- Symptomatic hypertension is typically revealed through end organ damage to the cardiac, central nervous system or renal systems.
- All symptomatic patients with hypertension should be transported with their head elevated.
- Consider aortic aneurysm if patient is experiencing severe or dull pain in the abdomen, chest, lower back or groin. Risk factors for aortic aneurysm include male patients (4 of 5 patients are males), greater than 60 years old, smoking, and diabetes.

---

A

If no IV access, administer Glucagon (GlucaGen) 1mg IM/SC

NO

Notify receiving facility or contact Medical Control

Respiratory rate <4 bpm

YES

PEARLS:
- NO PATIENT IS DEAD UNTIL WARM AND DEAD!
- Defined as core temperature less than 95°F (35°C).
- Extremes of age are more susceptible (i.e., young and old).
- With temperature less than 86°F (30°C) ventricular fibrillation is a common cause of death. Handling patients gently may prevent this.
- If the temperature is unable to be measured, treat the patient based on the suspected temperature.
- Hypothermia may produce severe bradycardia so take at least 45 seconds to palpate a pulse.
- Hot packs can be activated and placed in the armpit and groin area. Care should be taken not to place the packs directly against the patient’s skin.
- Intubation can cause ventricular fibrillation so it should be done gently by the most experienced person.
- Do not hyperventilate the patient as this can cause ventricular fibrillation.
- If the patient’s temperature is less than 86°F (30°C) then only defibrillate one time if defibrillation is required. Normal defibrillation procedure may resume once the temperature reaches 86°F (30°C).
- Below 86°F (30°C) antiarrhythmics may not work and, if given, should be given at reduced intervals.
- Below 86°F (30°C) pacing should not be done.
History:
- Blood loss
  - Vaginal/gastrointestinal bleeding

No

Request additional fluid

See: Bradycardia Protocol

Notify receiving facility or contact Medical Control

PEARLS:
- Consider all possible causes of shock and treat per appropriate protocol.
- Hypotension can be defined as a systolic blood pressure of less than 90, however, shock is often present with a normal blood pressure and tachycardia may be the only manifestation.
- Push Dose Epi: Mix 1 ml of Epi 1:10,000 with 9 ml NS=Epi 1:100,000. Admin 1-2 ml (10-20 mcg) every 10-15 minutes for hypotension.
- Assess lung sounds frequently.
**History:**
- Age
- Time of last meal
- Last bowel movement/emet
- Improvement or worsening with food or activity
- Duration of problem
- Other sick contacts
- Past medical and surgical history
- Medications
- Menstrual history (pregnancy)
- Travel history
- Bloody emesis/diarrhea

**Significant Findings:**
- Pain
- Character of pain (constant/intermittent/sharp/dull/etc.)
- Distention
- Constipation
- Diarrhea
- Anorexia
- Radiation

**Associated symptoms (Helpful to localize source):**
- Fever
- Headache
- Blurred vision
- Weakness
- Malaise
- Mental status changes

**Differential:**
- CNS
  - Increased pressure
  - Headache
  - Stroke
  - CNS lesions
  - Trauma/hemorrhage
  - Vestibular
- Myocardial infarction
- Drugs
- GI/renal disorders
- Diabetic ketoacidosis
- Gynecologic disease
  - Ovarian cyst
  - PID
- Infections
- Electrolyte abnormalities
- Food/toxin induced
- Pregnancy
- Psychological

**PEARLS:**
- Use Broselow tape for pediatric drug dosages.
- Zofran (Ondansetron) can cause QT widening.
- Use ODT (orally disintegrating tablets) with caution in adult patients complaining of abdominal pain.
- For ODT, place one tablet on top of patient’s tongue.
- Beware of vomiting in children. Pyloric stenosis, bowl obstruction and central nervous system processes (bleeding tumors, or increased cerebral spinal fluid pressure) all often present with vomiting.
- Document the mental status and vital signs prior to administration of antiemetic medications.
Obstetrical Emergencies

**History:**
- Due date
- Medications/illicit drug use
- Prenatal care
- Gravida/para
- High risk pregnancy
- Time contractions started/how often
- Rupture of membranes
- Time/amount of any vaginal bleeding
- Sensation of fetal activity
- Past medical and delivery history

**Significant Findings:**
- Spasmodic pain
- Vaginal discharge/bleeding
- Crowning/urge to push
- Meconium

**Differential:**
- Abnormal presentation
  - Buttock
  - Foot
  - Hand
- Prolapsed cord
- Placenta previa
- Abruptio placenta
- Ectopic pregnancy

---

**Assess for crowning**

**Check for:**
- Nuchal cord
- Prolapsed cord
- Breech birth
- Multiple births

**Monitor and reassess; document frequency and duration of contractions**

**Oxygen**
- Initiate IV; infuse fluid at a rate sufficient to prevent hypovolemic shock

**Position mother for birth**

**Gently press on perineum to prevent explosive birth and unnecessary tearing**
- Anterior shoulder normally delivers first followed by posterior shoulder
- Suction mouth and then nose
- Keep baby at level of the vagina until cord is cut
- Clamp and cut cord
- Record infant APGAR
- Suction, warm and dry the infant
- Deliver placenta

**Perform uterine massage**

**Facilitate breast feeding to increase uterine contraction**

**Oxytocin (Pitocin) 20 units (in 1,000 mL Normal Saline) slow IV administration; titrate according to severity of bleeding**

**Notify receiving facility or contact Medical Control**

**Yes**

**Excessive bleeding >500 ml**

**No**

**PEARLS:**
- Position for birth: semi-fowlers with knees drawn up and apart with buttocks elevated.
- Create a sterile field around vaginal opening.
- If nuchal cord is present, attempt to slip cord around neck. Clamp and cut if unable to remove cord.
- If prolapsed cord is present, do not attempt to place cord back into vagina. Instead, cover cord with a moist dressing and do not over-stimulate. If the baby is on the cord, insert two fingers into the vagina and attempt to lift the baby off the cord.
- In the case of a breech birth, attempt to prevent delivery. Have the mother blow hard and constant. If birth is imminent, place the mother semi-fowlers with her knees high to her chest. Do not pull the baby and let the delivery proceed naturally. If the baby’s head does not deliver, insert two fingers into the vagina in the shape of a “V” in an effort to create an airway for the infant.
- **Keep the infant warm!** Dry infant, place infant on mother’s chest (skin to skin); cover both infant and mother.
- Document all times (contraction frequency, length and delivery).
- Record APGAR at 1 minute and 5 minutes after birth.
- Consider transport prior to placenta delivery.
Pain Management (Adult)

History:
• Age
• Location
• Duration
• Severity (1-10 or Wong-Baker faces scale)
• Past medical history
• Medications
• Drug allergies

Significant Findings:
• Severity (pain scale)
• Quality (sharp/dull/etc.)
• Radiation
• Relation to movement
• Respiration
• Increase with palpation of area

Differential:
• Musculoskeletal
• Head trauma
• Visceral (abdominal)
• Cardiac
• Pleural/respiratory
• Neurogenic
• Renal (colic)

Pearls:
• Pain severity (0-10) is a vital sign to be recorded pre and post IV or IM medication delivery, and at disposition.
• Vital signs should be obtained pre, 5 minutes post, and at disposition with all pain medications.
• Zofran (Ondansetron) can cause QT widening.
• Contraindications to narcotic use include hypotension, head injury, respiratory distress or severe COPD.
• Contraindications to Toradol include active bleed (including ulcer and GI) current anticoagulation therapy, pregnant or CVA/TBI < 24 hours
• All patients should have drug allergies documented prior to administering pain medications, and avoid medications with a history of an allergy or reaction.
• Assess for significant head trauma or GCS less than 13. If present, withhold pain management.
• Maximize the use of non-pharmaceutical pain management techniques (e.g., positioning, padding and splinting, reassurance, heat/cold therapy, etc.) whenever possible.
• All patients receiving prehospital narcotic analgesic or benzodiazepines should have continuous pulse oximetry monitoring, EKG, and non-invasive capnography (if available). All patients who receive IM or IV medications must be observed 15 minutes for drug reaction.
• Stop Morphine administration if significant adverse effects (severe nausea, vomiting, signs of poor perfusion, respiratory depression) or sedation (decreased mental status) develop.
• Respiratory depression should be treated with Oxygen and ventilatory support if necessary.
• Attempt verbal and tactile stimulation to reverse respiratory depression prior to considering Naloxone (Narcan).
• Administer the smallest possible reversal dose of Naloxone (Narcan) to maintain adequate respirations.

Severe pain from extremity injuries, burns, hip injuries, sickle cell crisis, etc.

F  Oxygen
I  Initiate IV, INT not acceptable
B  Complete set of vital signs including SAo2

Severe pain >6 out of 10 or Indication for IV/IM medication

Normal Saline 20 mL/kg IV; max 60 mL/kg or 1,000 mL

Systolic BP >90

Toradol 15 mg IV\30 mg IM or Morphine 0.1 mg\kg IV\IM up to 5 mg

Consider Zofran (Ondansetron) 4 mg IV/

Must reassess patient at least every 5 minutes after sedative medication

Systolic BP >90

Persistent pain after 5-10 minutes

Morphine 0.1 mg\kg IV\IM up to 5 mg

Notify receiving facility or contact Medical Control
**Poisoning/Overdose**

**History:**
- Past medical history
- Ingestion or suspected ingestion of a potentially toxic substance
- Substance ingested/route/quantity
- Time of ingestion
- Reason
  - Suicidal
  - Accidental
  - Criminal
- Available medications in home
- Prescribed medications

**Significant Findings:**
- Mental status changes
- Hypotension/hypertension
- Decreased respiratory rate
- Seizures
- S.L.U.D.G.E.
- D.U.M.B.B.E.L.S.

**Differential:**
- Tricyclic antidepressants (TCA's)
- Acetaminophen (Tylenol)
- Aspirin
- Depressants
- Stimulants
- Anticholinergic
- Cardiac medications
- Solvents/alcohols/cleaning agents
- Insecticides (organophosphates)

**F**
- Naloxone (Narcan) 2 mg IV/IM if patient experiencing respiratory depression; may repeat once

**B**
- 12-Lead EKG

**I**
- Obtain BGL

**A**
- Initiate IV

**Glucose <60 with signs of hypoglycemia**

**See: AMS/ Diabetic Emergency Protocol**

**Calcium channel blockers:**
- Hypotension and bradycardia

**Tricyclic antidepressant:**
- Hypotension, tachycardia, and QRS >0.12

**Organophosphate poisoning:**
- Hypotension and tachycardia; S.L.U.D.G.E.

**Beta blocker:**
- Hypotension and bradycardia

**PEARLS:**
- Do not rely on patient history of ingestion, especially in suicide attempts. Make sure patient is not carrying other medications or weapons.
- Bring bottles, contents, and emesis to the emergency department.
- Tricyclic: seizures, dysrhythmias, hypotension, decreased mental status or coma; rapid progression from alert mental status to death.
- Acetaminophen: initially normal or nausea/vomiting. If not detected and treated, causes irreversible liver failure.
- Aspirin: early signs consist of abdominal pain and vomiting. Tachypnea and altered mental status may occur later. Renal dysfunction, liver failure, and cerebral edema, among other things, can take place later.
- Depressants: decreased HR, decreased BP, decreased temperature, decreased respirations, non-specific pupils.
- Stimulants: increased HR, increased BP, increased temperature, dilated pupils, seizures.
- Anticholinergic: increased HR, increased temperature, dilated pupils, mental status changes.
- Cardiac medications: dysrhythmias and mental status changes.
- Solvents: nausea, coughing, vomiting, and mental status changes.
- Insecticides: increased or decreased HR, increased secretions, nausea, vomiting, diarrhea, pinpoint pupils.
- Narcotics/opiates: decreased HR, decreased BP, decreased respirations, pinpoint pupils.

Consider restraints if necessary for patient’s and/or personnel’s protection per the Behavioral Emergencies/Chemical Restraints Protocol.

**Notify receiving facility or contact Medical Control**

**Calcium Gluconate (Kalcinate) 5-20 mL IV**

**P**
- Sodium Bicarbonate 1 mEq/kg IV

**A**
- Glucagon (GlucaGen) 2 mg IV

**Calcium channel blockers:**
- Hypotension and bradycardia

**Tricyclic antidepressant:**
- Hypotension, tachycardia, and QRS >0.12

**Organophosphate poisoning:**
- Hypotension and tachycardia; S.L.U.D.G.E.

**Beta blocker:**
- Hypotension and bradycardia

**PEARLS:**
- Do not rely on patient history of ingestion, especially in suicide attempts. Make sure patient is not carrying other medications or weapons.
- Bring bottles, contents, and emesis to the emergency department.
- Tricyclic: seizures, dysrhythmias, hypotension, decreased mental status or coma; rapid progression from alert mental status to death.
- Acetaminophen: initially normal or nausea/vomiting. If not detected and treated, causes irreversible liver failure.
- Aspirin: early signs consist of abdominal pain and vomiting. Tachypnea and altered mental status may occur later. Renal dysfunction, liver failure, and cerebral edema, among other things, can take place later.
- Depressants: decreased HR, decreased BP, decreased temperature, decreased respirations, non-specific pupils.
- Stimulants: increased HR, increased BP, increased temperature, dilated pupils, seizures.
- Anticholinergic: increased HR, increased temperature, dilated pupils, mental status changes.
- Cardiac medications: dysrhythmias and mental status changes.
- Solvents: nausea, coughing, vomiting, and mental status changes.
- Insecticides: increased or decreased HR, increased secretions, nausea, vomiting, diarrhea, pinpoint pupils.
- Narcotics/opiates: decreased HR, decreased BP, decreased respirations, pinpoint pupils.

Consider restraints if necessary for patient’s and/or personnel’s protection per the Behavioral Emergencies/Chemical Restraints Protocol.
Opioid Overdose (First Responder Only)

**History:**
- Past medical history
- Ingestion or suspected ingestion of a potentially toxic substance
- Substance ingested/route/quantity
- Time of ingestion
- Reason
  - Suicidal
  - Accidental
  - Criminal
- Available medications in home
- Prescribed medications

**Significant Findings:**
- Unresponsive
- Not Breathing / Agonal breathing
- Presence of drug paraphernalia
- Constricted “pinpoint” pupils
- Cyanosis
- Slow or absent pulse
- Slurred speech

**Differentials:**
- Opioid overdose (morphine, methadone, hydrocodone, oxycodone, heroin, OxyContin, Percocet, Vicodin, Percodan, Demerol)

---

**Scene safety**

- No Pulse and no Breathing

**Assess respirations and pulse**

- Inadequate Respirations / Unresponsive

**Oxygen**

- Naloxone (Narcan) Spray 4 mg IN, if patient experiencing respiratory depression due to suspected opioid overdose

**Reassess:**
- Increase in respirations and or responsiveness?

- Yes
  - Monitor ABC’s

- No
  - Repeat; Naloxone (Narcan) Spray 4 mg IN

Ensure EMS is enroute

**PEARLS:**
- Crew / Provider safety is priority.
- Narcotics/opiates: decreased HR, decreased BP, decreased respirations, pinpoint pupils.
- Consider restraints if necessary for patient’s and/or personnel’s protection department policies.
- Naloxone IM may be used in the place of IN if available.
**Reactive Airway Disease**

**History:**
- Asthma/COPD
  - Chronic bronchitis
  - Emphysema
  - Congestive heart failure
- Home treatment
  - Oxygen
  - Nebulizer
- Medications
  - Theophylline
  - Steroids
  - Inhalers
- Toxic exposure/smoke inhalation

**Significant Findings:**
- Shortness of breath
- Absence of lung sounds
- Pursed lip breathing
- Decreased ability to speak
- Increased respiratory rate and effort
- Wheezing/rhonchi
- Use of accessory muscles
- Tachycardia
- Barreled chest/clubbed fingers
- Chronic signs of hypoxia
- Waveform capnography indicative of constriction

**Differential:**
- Asthma
- Anaphylaxis
- Aspiration
- COPD (emphysema/bronchitis)
- Pleural effusion
- Pneumonia
- Pulmonary embolus
- Pneumothorax
- Cardiac (MI/CHF)
- Pericardial tamponade
- Hyperventilation
- Inhaled toxin (carbon monoxide/etc.)

**Oxygen and O2 sat**
- Combivent (DuoNeb) or Albuterol (Ventolin) 5 mg via nebulizer; may repeat once
- 12-Lead EKG
- Initiate IV

**Mild:**
- Speak in full sentences
- RR <30
- O2 Sat >94 on room air
- Wheezing
- Minimal accessory muscle use

**Moderate:**
- Speak in short sentences
- RR: 30-40
- O2 sat: 91-94 on room air
- Diminished lung sounds
- Normal mental status
- Accessory muscle use

**Life threatening/severe exacerbation:**
- 1-2 word sentences
- RR >40 or <10
- O2 sat <91 on room air
- Little or no lung sounds
- Accessory muscle use with tripod position
- Diaphoretic and anxious
- High EtCo2

**PEARLS:**
- Treatment should escalate or decrease with patient presentation.
- Methylprednisolone (Solumedrol) is for COPD, asthma and anaphylaxis only!
- Magnesium Sulfate is administered by putting 2 grams/4 mL in a 50 mL bag with a 10 gtt set at 50 drops per minute.
- Pulse oximetry should be monitored continuously if initial saturation is less than or equal to 96, or there is a decline in patient status despite normal pulse oximetry readings.
- Contact Medical Control prior to administering Epinephrine in patients who are greater than 50 years of age, have a history of cardiac disease, hypertension, or if the patient’s heart rate is greater than 150. Epinephrine may precipitate cardiac ischemia.
- A silent chest in respiratory distress is a pre-respiratory arrest sign.
- EtCO2 should be used when respiratory distress is significant and does not respond to initial beta-agonist dose.
- Do not administer Combivent (DuoNeb) if patient is allergic to soybeans or peanuts.
- All efforts at verbal coaching should be utilized prior to conscious sedation.
- For Conscious sedation, see Sedation/Anxiety protocol. Dose should be titrated to provide comfort without causing unconsciousness or respiratory failure. Be sure to monitor patient’s breathing/ventilations, blood pressure and O2 saturation.
**Medical Indications:**
- Cardioversion
- Anxiety associated with CPAP
- Transcutaneous pacing
- Anxiety associated with Burns
- Severe anxiety
- Traumatic injury patient in which extrication and or movement will cause anticipated severe pain.

**PEARLS:**
- **Severe anxiety:** Inhibits assessment, respiratory rate >30, inability to be reassured by non-pharmaceutical methods.
- **CPAP:** Dose should be titrated to provide comfort without causing unconsciousness or respiratory failure; just enough to reduce agitation.
- **Procedural Sedation:** Cardioversion, transcutaneous pacing, or traumatic injury patient in which extrication and or movement will cause anticipated severe pain.
- Always be prepared for airway management during sedation, **Ketamine** can cause laryngospasms.
- **Ketamine** is contraindicated in severe hypertension (>210 systolic or >110 diastolic).
- Be sure to monitor the patient’s breathing with continuous waveform capnography, blood pressure, heart rate, and O2 saturation after administration of **Ketamine**, **Midazolam**, or **Lorazepam**.
- **Ketamine dose of 1 mg/kg will cause disassociation and unconsciousness even though patient will appear awake.**
- **Ketamine** can cause a heightened sympathetic response that will increase heart rate and blood pressure. Use caution in severe hypertension.
**Seizures**

**History:**
- Reported/witnessed seizure activity
- Previous seizure history
- Medical alert tag information
- Seizure medications
- History of trauma
- History of diabetes
- History of pregnancy

**Significant Findings:**
- Decreased mental status
- Sleepiness
- Incontinence
- Observed seizure activity
- Evidence of trauma
- Unconscious

**Differential:**
- CNS (head)/trauma/stroke
- Tumor
- Metabolic, hepatic, or renal failure
- Hypoxia
- Electrolyte abnormality (Na, Ca, Mg)
- Drugs/medications
- Non-compliance
- Infection/fever
- Alcohol withdrawal
- Eclampsia
- Hyperthermia
- Hypoglycemia

**PEARLS:**
- Status epilepticus is defined as two or more successive seizures without a period of consciousness or recovery. This is a true emergency requiring rapid airway control, treatment, and transport.
- Grand mal seizures (generalized) are associated with loss of consciousness, incontinence, and tongue trauma.
- Focal seizures (petit mal) effect only a part of the body and are not usually associated with a loss of consciousness.
- Jacksonian seizures are seizures which start as a focal seizure and become generalized.
- Be prepared for airway problems and continued seizures.
- Assess possibility of occult trauma and substance abuse.
- Be prepared to assist ventilations especially if Midazolam (Versed) or Diazepam (Valium) is used.
- For any seizure in a pregnant patient, follow the Eclampsia/Pre-eclampsia Protocol.
- Consider Lorazepam (Ativan) 1-4 mg slow IV push if hypotensive.
- The maximum dose without Medical Control for Lorazepam (Ativan) is 4 mg and Midazolam (Versed) is 7.5 mg. DO NOT exceed maximum.
**Sepsis**

**History:**
- Age > 18 Years
- Duration of fever
- Severity of fever
- Altered mental status
- Past medical history
- Medications
- Immunocompromised (Transplant, HIV, Diabetes, Cancer)
- Environmental exposure
- Last Acetaminophen or Ibuprofen

**Significant Findings:**
- Hyperthermia (>100.4°F/38°C)
- Hypothermia (<96.8°F/36°C)
- Tachypnea (> 20 bpm, or mechanical)
- Tachycardia (> 90 Bpm)
- Acute mental status change
- Urinary tract infection
- Pneumonia
- Skin/soft tissue infection
- Abdominal infection
- Wound infection
- Suspected meningitis, endocarditis or osteomyelitis

**Collecting Cultures:**
- Maintain aseptic technique at all times
- Put on a new set of clean gloves
- Prepare site with Chloraprep
  - Clean 2 inch site
  - Allow site to dry
  - Do not touch once cleaned
- Remove cap from culture bottles
- Clean bottle diaphragm with alcohol
- Allow to dry
- Venipuncture and draw blood
- Add 5-10ml of blood in each bottle
  - Aerobic (BLUE/GRAY) first
  - Anaerobic (PURPLE) second

**Pearls:**
- If unable to obtain cultures, do not administer antibiotics
- Determine the hospital destination (SFHS or GHS) prior to drawing cultures. Use the appropriate kit.
- Utilize Sepsis Checklist
- Septic shock - Hypotension (SBP <90) refractory to fluid bolus (30ml/kg NS), Consider Push Dose Epi 10-20 mcg q10-15 minutes
- Be alert for signs of anaphylaxis during antibiotic administration
- A second liter of Normal Saline can be administered for septic shock
- Extended scene times to provide antibiotic theory are acceptable
- Withhold antibiotics if suspect meningitis, endocarditis, or osteomyelitis
- Zosyn should be administered to all nursing home patients who meet sepsis alert criteria without a PCN allergy regardless of the source.
**History:**
- Previous CVA/TIA
- Previous cardiac/vascular surgery
- Associated diseases
  - Diabetes
  - Hypertension
  - CAD
- Atrial fibrillation
- Medications (blood thinners)
- History of trauma

**Significant Findings:**
- Altered mental status
- Weakness/paralysis
- Blindness or other sensory loss
- Aphasia/dysarthria
- Syncope
- Vertigo/dizziness
- Vomiting
- Headache
- Seizures
- Respiratory pattern change
- Hypertension/hypotension

**Differential:**
- Altered mental status
- TIA
- Seizure
- Hypoglycemia
- Tumor
- Trauma
- Todd’s paralysis
- Stroke
  - Thrombotic or Embolic (~85%)
  - Hemorrhagic (~15%)
- Dialysis/renal failure

**PEARS:**
- **Acute Stroke** involves onset of symptoms <4 1/2 hours. Any RACE ≥ 5 and onset symptoms ≥ 4 1/2 but ≤ 24 hours is a Stroke Alert
- **Major Stroke** involves patient with an altered level of consciousness.
- All patients with new signs and symptoms of a stroke regardless of time onset are to be transported to a cardiac/stroke center (Greenville Memorial Medical Center, St. Francis Hospital-Downtown, St, Francis Hospital-Eastside, or Pelham Medical Center).
- Minimize scene time to 15 minutes.
- Onset of symptoms is defined as the last witnessed time the patient was symptom free (i.e., awakening with stroke symptoms would be defined as an onset time of the previous night when patient was symptom free).
- The differential listed on the Altered Mental Status Protocol should also be considered.
- Elevated blood pressure is commonly present with stroke.
- Be alert for airway problems (i.e., swallowing difficulty, vomiting, aspiration).
- Hypoglycemia can present as a localized neurologic deficit, especially in the elderly.
- Document the stroke screen results in the patient care report (PCR); complete R.A.C.E. score on all positive stroke screens.
- Document the 12-Lead EKG as a procedure in the PCR.
- Todd’s Paralysis is focal weakness in a part of the body after a seizure. This weakness typically affects appendages and is localized to either the left or right side of the body. It may also affect speech, eye position (gaze), or vision. It usually subsides completely within 48 hours.
- Transport to appropriate stroke center.

**Pearls:**
- Perform both Glasgow coma scale and Cincinnati stroke scale on patients who present with signs/symptoms of stroke.
Pediatric Medical Cardiac Arrest

**History:**
- Estimated downtime
- Medical history
- Medications
- Hypothermia
- Possibility of foreign body
- Events leading to arrest

**Significant Findings:**
- Unresponsive
- Pulseless
- Apneic
- No electrical activity on EKG
- Ventricular fibrillation/ventricular tachycardia
- No auscultated heart tones

**Differential:**
- Respiratory failure
  - Foreign body
  - Infection
- Hypovolemia (dehydration)
- Congenital heart disease
- Trauma
- Hypothermia
- Medication/toxin
- Hypoglycemia

**PEARLS:**
- Pediatric = 1 day to less than age 12, or less than 55 kg in ages 13-18.
- Use Broselow tape for drug dosages.
- The majority of pediatric arrests are due to airway problems, therefore airway is the most important intervention. This should be accomplished immediately. Patient survival is often dependent on airway management success.
- CPR 100-120 compressions per minute and at a depth of no less than 1/3 of anterior/posterior diameter of chest with interruptions of less than 5 seconds.
- Rotate compressors and check rhythm every 2 minutes.
- Monitor in paddles mode with metronome on.
- Always confirm asystole in more than one lead.
- Assign a team resuscitation leader and utilize checklist.
- Minimize patient movement.
- After an advanced airway is placed, rescuers no longer deliver "cycles" of CPR.
- Continue Epinephrine until rhythm changes or physician directs otherwise.
- Most maternal medications pass through breast milk to the infant. Consider Naloxone (Narcan) 0.1 mg/kg IV/IM; max 2 mg.
- Hypoglycemia, severe dehydration, and narcotic effects may produce bradycardia.
- In order to be successful in pediatric arrests, a cause must be identified and corrected.
- Reassess and document endotracheal tube placement and EtCO₂ frequently, after every move, and at transfer of care.
- Remove resQpod once a pulse is returned.
Pediatric Bradycardia

**History:**
- Past medical history
- Medications (maternal/infant)
- Foreign body exposure/swallowed
- Respiratory distress/arrest
- Infection
  - Croup
  - Epiglottitis
- Apnea
- Possible toxic/poison exposure
- Congenital heart disease

**Significant findings:**
- Decreased heart rate
- Delayed capillary refill/cyanosis
- Mottled, cool skin
- Hypotension
- Respiratory difficulty
- Altered level of consciousness

**Differential:**
- Respiratory failure
  - Foreign body
  - Infection
- Hypovolemia (dehydration)
- Congenital heart disease
- Trauma
- Tension pneumothorax
- Hypothermia
- Medication/toxin
- Hypoglycemia
- Acidosis

**Notify receiving facility or contact Medical Control**
**Pediatric Termination of Ventricular Rhythms**

**History:**
- Respiratory arrest
- Cardiac arrest

**Significant Findings:**
- Return of pulse

**Differential:**
- Address specific differentials associated with the original dysrhythmia

**PEARLS:**
- Pediatric = 1 day to less than age 12, or less than 55 kg in ages 13-18.
- Use Broselow tape for drug dosages and color chart.
- If patient remains hypotensive after initial Normal Saline bolus, contact Medical Control for additional fluid.
- Amiodarone drip table: All drips mixed in 50 mL bag Normal Saline using a 60 gtt set.

**Broselow Color**
- **Gray:** 25 mg/0.5 mL 1.5 gtt/min
- **Pink:** 35 mg/0.7 mL 2 gtt/min
- **Red:** 45 mg/0.9 mL 3 gtt/min
- **Purple:** 55 mg/1.1 mL 3 gtt/min
- **Yellow:** 70 mg/1.4 mL 4 gtt/min

Pediatric Unstable Tachycardia

**History:**
- Past medical history
- Medications/toxic ingestion
  - Aminophylline
  - Diet pills
  - Thyroid supplements
  - Decongestants
  - Digoxin
- Drugs (nicotine/cocaine)
- Congenital heart disease
- Prior history of tachycardia
- Syncope/near syncope
- Respiratory distress

**Significant findings:**
- Heart Rate
  - Child >180/bpm
  - Infant >220/bpm
- Pale/cyanotic
- Diaphoresis
- Tachypnea
- Unresponsive
- Hypotension

**Differential:**
- Congenital heart disease
- Hypo/hyperthermia
- Hypovolemia/anemia
- Electrolyte imbalance
- Anxiety/pain/emotional stress
- Fever/infection/sepsis
- Hypoxia
- Hypoglycemia
- Medication/toxin (see History)
- Pulmonary embolus
- Trauma
- Tension pneumothorax

**PEARS:**
- Pediatric = 1 day to less than age 12, or less than 55 kg in ages 13-18.
- Use Broselow tape for drug dosages.
- Carefully distinguish sinus tach, SVT, and V-tach. Rule of thumb: the maximum sustainable sinus tach rate is 220 minus the patient's age in years.
- Tachycardia in pediatrics is normally caused by hypoxia or hypovolemia. Identify and treat underlying causes.
- For conscious sedation administer Midazolam (Versed) 2.5 mg/0.5 mL IM if less than 13 kg; if greater than 13 kg administer Midazolam (Versed) 5 mg/1 mL IM; if IV obtained, administer Lorazepam (Ativan) 0.1 mg/kg IV; max 2 mg.
- Separating the child from the caregiver may worsen the child’s clinical condition.
- Pediatric paddles should be used in children less than 10 kg or Broselow color purple.
- Document all rhythm changes with monitor strips and obtain monitor strips with each therapeutic intervention.
- **Amiodarone drip table:** All drips mixed in 50 mL bag Normal Saline using a 60 gtt set.

<table>

**Oxygen**
- 12-Lead EKG
- Initiate IV/IO
- May attempt valsala maneuver (ice or cold rag to patient’s face)

**Cardiovert (synchronized)**
- 0.5-1 J/kg
- Increase to 2 J/kg if necessary

**Notify receiving facility or contact Medical Control**

**Adenosine (Adenocard)**
- 0.1 mg/kg IV/IO; max 6 mg
- 0.2 mg/kg IV/IO; max 12 mg
- Consider conscious sedation (see PEARLS)

**Amiodarone (Cordarone)**
- 5 mg/kg IV/IO over 20 min; max 150 mg
- Consider conscious sedation (see PEARLS)
- Cardiovert (synchronized) 0.5-1 J/kg; increase to 2 J/kg if necessary
Ped. Altered Mental Status/Diabetic Emergencies

**History:**
- Past medical history
- Medications
- Recent blood glucose check
- Last meal
- History of trauma
- Change in condition
- Changes in feeding/sleeping habits

**Significant Findings:**
- Altered mental status
- Lethargy
- Combative/irritable
- Hypoglycemia (cool, diaphoretic skin)
- Hyperglycemia (warm, dry skin, fruity breath, Kussmaul respirations: rapid, deep breathing, signs of dehydration)
- Seizure
- Abdominal pain
- Nausea/vomiting
- Weakness

**Differential:**
- Alcohol/drug use
- Toxic ingestion
- Head trauma
- CNS (stroke/tumor/seizure/infection)
- Altered baseline mental status
- Hypothermia/hyperthermia
- Thyroid (hyper/hypo)
- Shock
- Diabetes (hyper/hypoglycemia)
- Acidosis/alkalosis
- Environmental exposure
- Pulmonary (hypoxia)
- Electrolyte abnormality
- Psychiatric disorder

**Oxygen**

**F** Obtain BGL

**B** Initiate IV

**I**

**Glucose <60 with signs of hypoglycemia**
- Consider Oral Glucose 1-2 tubes if awake and no risk for aspiration

**Glucose >60 with altered mental status**
- 10% Dextrose (D10) 2-4 mL/kg IV; may repeat once if still unresponsive and low BGL

**Glucose >250 with signs of poor perfusion and/or dehydration**
- If no IV access, administer Glucagon (GlucaGen) 0.1 mg/kg IM/SQ; max 1 mg

**Notify receiving facility or contact Medical Control**

**PEARLS:**
- Pediatric = 1 day to less than age 12, or less than 55 kg in ages 13-18.
- Use Broselow tape for drug dosages.
- Be judicious and cautious when providing fluid to children in DKA.
- Low glucose (less than 60), normal glucose (60-120), high glucose (greater than 250).
- Pay careful attention to the head exam for signs of bruising or other injury.
- While infusing 10% Dextrose (D10), monitor the patient for changes in level of consciousness. Can be administered by EMT-I but a Paramedic must be the primary attendant.
- It is safer to assume hypoglycemia than hyperglycemia if doubt exists. Re-check blood glucose after administration of Dextrose or Glucagon (GlucaGen).
- Be aware of altered mental status as a presenting sign of an environmental toxin or Haz-Mat exposure and protect personal safety.
- Consider restraints if necessary for patient’s and/or personnel’s protection per the Behavioral Emergency/Chemical Restraint Protocol.

Current as of October 2018 Dr. Martin Lutz, Medical Director – Greenville County EMS
Pediatric Anaphylactic Shock/Allergic or Dystonic Reaction

**History:**
- Onset and location
- Insect sting/bite
- Food allergy/exposure
- Medication allergy/exposure
- New clothing, soap, detergent
- Past history/reactions
- Medication history
  - Antipsychotics
  - Antiemetics

**Significant Findings:**
- Itching/hives
- Coughing/wheezing/respiratory distress
- Chest/throat constriction
- Difficulty swallowing
- Hypotension/shock
- Edema

**Dystonic/extrapyramidal reaction**
- Involuntary muscle contractions of the face, chest, neck, back, and pelvis
- Deviated pupils
- Swollen tongue

**Differential:**
- Urticaria (rash only)
- Anaphylaxis (systemic effect)
- Shock (vascular effect)
- Angioedema (drug induced)
- Aspiration/airway obstruction
- Vasovagal event
- Asthma
- Congenital heart disease
- Infection
  - Pneumonia
  - Croup
  - Epiglottitis

**PEARLS:**
- Common medication groups that cause dystonic reactions include antipsychotics: Zyprexa (Olanzapine), Haloperidol (Haldol), Alprazolam (Xanax), Fluphenazine (Prolixin), Thorazine (Chlorpromazine), Ziprasidone (Geodon) and antiemetics: Compazine (Prochlorperazine), Promethazine (Phenergan), Hydroxyzine (Vistaril), Metoclopramide (Reglan).
- If the patient is hemodynamically unstable, request an order of Epinephrine 1:10,000 0.01 mg/kg IV/IO; max 0.3 mg.
# Pediatric Fever/Infection Control

## History:
- Age
- Duration of fever
- Severity of fever
- Past medical history
- Medications
- Immunocompromised
  - Transplant
  - HIV
  - Diabetes
  - Cancer
- Environmental exposure
- Last Acetaminophen or Ibuprofen

## Significant Findings:
- Warm
- Flushed
- Sweaty
- Chills/rigors

### Associated Symptoms (Helpful to localize source)
- Myalgias
- Chest pain
- Cough
- Headache
- Dysuria
- Mental status changes
- Rash

## Differential:
- Infections/sepsis
- Cancer/tumors/lymphomas
- Medication/drug reaction
- Connective tissue reaction
- Arthritis
- Vasculitis
- Hyperthyroidism
- Heat stroke
- Meningitis

## Contact, droplet, and airborne precautions

<table>
<thead>
<tr>
<th>F</th>
<th>Orthostatic blood pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Measure temperature</td>
</tr>
<tr>
<td>I</td>
<td>Consider Normal Saline 20 mL/kg IV; max 60 mL/kg or 1,000 mL</td>
</tr>
</tbody>
</table>

**Temperature >100.4°F (38 °C); if awake and no risk for aspiration**

- Yes
  - **P** Acetaminophen (Tylenol) 15 mg/kg PO
- No

Notify receiving facility or contact Medical Control

## Pearls:
- Pediatric = 1 day to less than age 12, or less than 55 kg in ages 13-18.
- Use Broselow tape for pediatric drug dosages.
- Acetaminophen quick calculation: Weight in kg/2 = dose in mL.
- Febrile seizures are more likely in children with a history of febrile seizures and with a rapid elevation in temperature.
- Patients with a history of liver failure should not receive Acetaminophen (Tylenol).
- Droplet precautions include standard PPE plus a standard surgical mask for providers who accompany patients in the back of the ambulance and a surgical mask or non-rebreather O₂ mask for the patient. This level of precaution should be utilized when influenza, meningitis, mumps, streptococcal pharyngitis, and other illnesses spread via large particle droplets are suspected. A patient with a potentially infectious rash should be treated with droplet precautions.
- Airborne precautions include standard PPE plus utilization of a gown, change of gloves after every patient contact, and strict hand washing precautions. This level of precaution is utilized when multi-drug resistant organisms (i.e., MRSA), scabies, or zoster (shingles), or other illnesses spread by contact are suspected.
- All-hazards precautions include standard PPE plus airborne precautions plus contact precautions. This level of precaution is utilized during the initial phases of an outbreak when the etiology of the infection is unknown or when the causative agent is found to be highly contagious (i.e., SARS).
- Rehydration with fluids increases the patient’s ability to sweat and improves heat loss.
- All patients should have drug allergies documented prior to administering pain medications.
- NSAID’s should not be used in the setting of environmental heat emergencies.
Pediatric Medical Hypotension

**History:**
- Blood
- Fluid loss (vomiting/diarrhea/fever)
- Infection
- Congenital defects
- Birth complications
- Medications
- Allergic reaction
- History of poor oral intake

**Significant Findings:**
- Restlessness
- Confusion
- Weakness
- Dizziness
- Weak, rapid pulse
- Pale, cool, clammy skin
- Delayed capillary refill
- Decreased blood pressure

**Differential:**
- Shock
- Trauma
- Infection
- Dehydration
- Congenital heart disease
- Medication/toxin
- Allergic reaction

**History:**
- Blood
- Fluid loss (vomiting/diarrhea/fever)
- Infection
- Congenital defects
- Birth complications
- Medications
- Allergic reaction
- History of poor oral intake

**Significant Findings:**
- Restlessness
- Confusion
- Weakness
- Dizziness
- Weak, rapid pulse
- Pale, cool, clammy skin
- Delayed capillary refill
- Decreased blood pressure

**Differential:**
- Shock
- Trauma
- Infection
- Dehydration
- Congenital heart disease
- Medication/toxin
- Allergic reaction

**Pearls:**
- Pediatric = 1 day to less than age 12, or less than 55 kg in ages 13-18.
- Use Broselow tape for drug dosages.
- Consider all possible causes of shock and treat per appropriate protocol.
- Consider possible allergic reaction or early anaphylaxis.
- Decreasing heart rate and hypotension occur late in children and are signs of imminent cardiac arrest.
- Work of breathing is a better indicator of oxygenation and ventilation than rate and lung sounds.
- Most maternal medications pass through breast milk to the infant. Consider Naloxone (Narcan) 0.1 mg/kg IV/IO; max 2 mg.
- If the patient has a history of cardiac disease (e.g., prematurity), chronic lung disease, or renal disease, limit Normal Saline bolus to 10 mL/kg.

**Normal Saline 5 mL/kg IV; max 60 mL/kg or 1,000 mL**
- Push Dose Epi 10 mcg (1 ml) q10-15 minutes

**Normal Saline 20 mL/kg IV; max 60 mL/kg or 1,000 mL**
- Improvement
  - Yes
    - Normal Saline 20 mL/kg IV; max 60 mL/kg or 1,000 mL
    - M Request additional fluid
  - No
    - Notify receiving facility or contact Medical Control

**Abnormal appearance + Poor circulation = SHOCK**
- Stridor - upper airway obstruction
- Wheezing - partially blocked small airways
- Grunting - lower airway (pneumonia)
- Retractions - suprasternal, intercostal, or subcostal
- Nasal flaring
- Positioning

**Abnormal appearance + Change in work of breathing = RESPIRATORY FAILURE**

**Abnormal appearance + Change in work of breathing = RESPIRATORY DISTRESS**

**Appearance**
- Often the first clue to a problem
- Tone
- Interactiveness
- Consolability
- Look/gaze (eye contact)
- Speech/cry

**Skin circulation**
- Reflects overall adequacy of perfusion

**Abnormal audible breath sounds**
- Stridor - upper airway obstruction
- Wheezing - partially blocked small airways
- Grunting - lower airway (pneumonia)
- Retractions - suprasternal, intercostal, or subcostal
- Nasal flaring
- Positioning

**Age based SBP Hypotension:**
- less than 1 year: less than 70
- 1-10 years: less than 70 + (2 x age)
- greater than 11: less than 90 + (2 x age)

**Notify receiving facility or contact Medical Control**

**Use age appropriate heart rate and blood pressure levels**

**Normal Saline 5 mL/kg IV; max 60 mL/kg or 1,000 mL**
- Push Dose Epi 10 mcg (1 ml) q10-15 minutes
Pediatric Reactive Airway Disease

**History:**
- Time of onset
- Possibility of foreign body
- Medical history
- Medications
- Fever or respiratory infection
- Other sick siblings/contacts
- History of trauma

**Significant Findings:**
- Wheezing/stridor
- Respiratory retractions
- Increased heart rate
- Altered level of consciousness
- Nasal flaring/tripoding
- Anxious appearance

**Differential:**
- Asthma/epiglottitis
- Allergic reaction
- Aspiration/foreign body
- Infection
  - Pneumonia
  - Croup
- Congenital heart disease
- Medication/toxin
- Trauma

### Assess severity of symptoms; allow patient to maintain a position of comfort (usually sitting)

**Oxygen and pulse oximetry**

**Wheezing**
- **A** Albuterol (Ventolin) 2.5 mg via nebulizer, may repeat once to max 5 mg
- **I** Initiate IV if O₂ <92% after first treatment
- **M** For severe respiratory distress characterized by difficulty speaking, accessory muscle use, or low O₂; request Epinephrine 1:1,000 0.3 mg SQ

**Stridor**
- **P** Consider Racemic Epinephrine 0.5 mL (diluted to 3 mL with Normal Saline) via nebulizer, may NOT be repeated
- **I** Initiate IV if O₂ <92% after first treatment
- **M** For severe respiratory distress characterized by difficulty speaking, accessory muscle use, or low O₂; request Epinephrine 1:1,000 0.3 mg SQ

**Notify receiving facility or contact Medical Control**

**PEARLS:**
- Pediatric = 1 day to less than age 12, or less than 55 kg in ages 13-18.
- Use Broselow tape for drug dosages.
- Pulse oximetry should be monitored continuously if initial saturation is less than or equal to 96%, or there is a decline in patient status despite normal pulse oximetry readings.
- Do not force a child into a position. They will protect their airway by their body position.
- The most important component of respiratory distress is airway control. Avoid direct laryngoscopy unless intubation is imminent.
- Asthma is the most commonly seen obstructive airway disease in pediatric patients, as with adults, asthma causes outflow obstruction (wheezing) because of narrowing of the lower airways.
- Narrowing of the upper airway, as with croup and acute epiglottitis will present with stridor. These patients have the potential to progress to ventilatory failure. Direct visualization of the upper airway of these patients should be limited.
- Bronchiolitis is a viral infection typically affecting infants resulting in wheezing which may not respond to beta-agonists. Consider Epinephrine if patient is less than 18 months and not responding to initial beta-agonist treatment.
- Croup typically affects children less than 2 years of age. It is viral, possible fever, gradual onset, no drooling is noted.
- Epiglottitis typically affects children greater than 2 years of age. It is bacterial, with fever, rapid onset, possible stridor, patient wants to sit up to keep airway open, drooling is common. Airway manipulation may worsen the condition.

**Appearance**
- Often the first clue to a problem
- Tone
- Interactiveness
- Consolability
- Look/gaze (eye contact)
- Speech/cry

**Skin circulation**
- Reflects overall adequacy of perfusion

**Abnormal audible breath sounds**
- Stridor - upper airway obstruction
- Wheezing - partially blocked small airways
- Grunting - lower airway (pneumonia)
- Retractions - suprasternal, intercostal, or subcostal
- Nasal flaring
- Positioning

**Abnormal appearance + Poor circulation = SHOCK**
**Abnormal appearance + Change in work of breathing = RESPIRATORY FAILURE**
**Normal appearance + Change in work of breathing = RESPIRATORY DISTRESS**

Current as of October 2018 Dr. Martin Lutz, Medical Director – Greenville County EMS
**Newly Born**

**History:**
- Due date and gestational age
- Multiple gestation (twins, etc.)
- Meconium
- Delivery difficulties
- Congenital disease
- Medications (maternal)
- Maternal risk factors
  - Substance abuse
  - Smoking

**Significant Findings:**
- Respiratory distress
- Peripheral cyanosis/mottling (normal)
- Central cyanosis (abnormal)
- Altered level of responsiveness
- Bradycardia

**Differential:**
- Airway failure
  - Secretions
  - Respiratory drive
- Infection
- Maternal medication effect
- Hypovolemia
- Hypoglycemia
- Congenital heart disease
- Hypothermia

---

**Suction mouth and then nose**

**Keep baby at level of the vagina until cord is cut**

**Clamp and cut cord**

**Record infant APGAR**

**Dry the infant; keep infant warm**

**Use tactile stimulation to rouse the infant**

**If thick meconium in amniotic fluid, consider oral intubation**

---

**Respirations present**

**Yes**

**Heart rate <100 with persistent cyanosis**

---

**Position infant supine or on side with neck in neutral position**

**BVM 30 sec at 40-60 breaths/min with 100% Oxygen**

---

**Heart rate <60**

**Heart rate 60-100**

---

**Begin CPR for 2 min or until spontaneous heart rate >80**

**Continue to monitor**

**Reassess 5 min APGAR**

**Continue Oxygen**

**Notify receiving facility or contact Medical Control**

---

**PEARLS:**
- Neonate = birth to 1 day.
- Maternal sedation or narcotics will sedate the infant.
- CPR 100-120 compressions per minute and at a depth of no less than 1/3 of anterior/posterior diameter of chest with interruptions less than 5 seconds.
Pediatric Pain Management

**History:**
- Age
- Location
- Duration
- Severity (1 - 10)
- If child use Wong-Baker faces scale

Past medical history
- Medications
- Drug allergies

**Signs and Symptoms:**
- Severity (pain scale)
- Quality (sharp, dull, etc.)
- Radiation
- Relation to movement,
- Respiration
- Increased with palpation of area

**Differential:**
- Per the specific protocol
- Musculoskeletal
- Visceral (abdominal)
- Cardiac
- Pleural / Respiratory
- Neurogenic

---

**Isolated extremity traumatic pain**

- **Oxygen**
- **Initiate IV, INT not acceptable**
- **Full set of vital signs including SAO2**

**Pain Severity >6 out of 10**
- Or
- **Indications for IV/IM medication**

**Age appropriate BP**
- **(see PEARLS)**

**Normal Saline 20 mL/kg IV, max 60 mL/kg or 1,000 mL**
- **No**

**Age appropriate BP**
- **Yes**

**Toradol 0.5 mg/kg, Max 15 mg IV/30 mg IM**
- or
- **Morphine 0.1 mg/kg IV/IM up to 5mg; may repeat once q 5 minutes to max of 10mg**
- **Must reassess patient at least every 5 minutes after sedative medication**

**8-15 kg:**
- **Zofran (ondansetron) 2mg IV/IM**

**>15 kg:**
- **Zofran (ondansetron) 4mg IV/IM**

---

**PEARLS:**
- Pediatric = 1 day to less than age 12, or less than 55 kg in ages 13-18.
- Use Broselow tape for drug dosages. Toradol restricted to patients 2 years of age or older.
- Pain severity (0-10) is a vital sign to be recorded pre, 5 min post, and at disposition with all pain medications.
- **Age based hypotension:**
  - less than 1 year: less than 70 SBP
  - 1-10 years: less than 70 + (2 x age) SBP
  - greater than 11: less than 90 + (2 x age) SBP
- **Zofran (Ondansetron)** can cause QT widening.
- **Contraindications to narcotic use include hypotension, head injury, respiratory distress**.
- All patients should have drug allergies documented and avoid medications with a history of an allergy or reaction.
- Assess for significant head trauma or GCS less than 13. If present, withhold pain management.
- Maximize the use of non-pharmaceutical pain management techniques (e.g., positioning, padding and splinting, reassurance, heat/cold therapy, etc.) whenever possible.
- All patients receiving prehospital narcotic analgesic or benzodiazepines should have continuous pulse oximetry monitoring, EKG, and non-invasive capnography (if available). All patients who receive IM or IV medications must be observed 15 minutes for drug reaction.
- Stop **Morphine** administration if significant adverse effects (severe nausea, vomiting, signs of poor perfusion, respiratory depression) or sedation (decreased mental status) develop.
- Respiratory depression should be treated with **Oxygen** and ventilatory support if necessary.
- Attempt verbal and tactile stimulation to reverse respiratory depression prior to considering **Naloxone (Narcan)**.
- Administer the smallest possible reversal dose of **Naloxone (Narcan)** to maintain adequate respiration.
**Pediatric Poisoning/Overdose**

**History:**
- Past medical history
- Ingestion or suspected ingestion of a potentially toxic substance
- Substance ingested, route, quantity
- Time of ingestion
- Reason
  - Suicidal
  - Accidental
  - Criminal
- Available medications in home
- Prescribed medications

**Significant Findings:**
- Mental status changes
- Hypotension/hypertension
- Decreased respiratory rate
- Tachycardia/dysrhythmias
- Seizures
  - S.L.U.D.G.E.
  - D.U.M.B.B.E.L.S.

**Differential:**
- Tricyclic antidepressants (TCA’s)
- Acetaminophen (Tylenol)
- Aspirin
- Depressants
- Stimulants
- Anticholinergic
- Cardiac medications
- Solvents/alkohols/cleaning agents
- Insecticides (organophosphates)

---

**Pearls:**
- Do not rely on patient history of ingestion, especially in suicide attempts. Make sure patient is not carrying other medications or weapons.
- Bring bottles, contents, and emesis to the emergency department.
- Tricyclic: seizures, dysrhythmias, hypotension, decreased mental status or coma; rapid progression from alert mental status to death.
- Acetaminophen: initially normal or nausea/vomiting. If not detected and treated, causes irreversible liver failure.
- Aspirin: early signs consist of abdominal pain and vomiting. Tachypnea and altered mental status may occur later. Renal dysfunction, liver failure, and or cerebral edema, among other things, can take place later.
- Depressants: decreased HR, decreased BP, decreased temperature, decreased respirations, non-specific pupils.
- Stimulants: increased HR, increased BP, increased temperature, dilated pupils, seizures.
- Anticholinergic: increased HR, increased temperature, dilated pupils, mental status changes.
- Cardiac medications: dysrhythmias and mental status changes.
- Solvents: nausea, coughing, vomiting, and mental status changes.
- Insecticides: increased or decreased HR, increased secretions, nausea, vomiting, diarrhea, pinpoint pupils.
- Narcotics/opiates: decreased HR, decreased BP, decreased respirations, pinpoint pupils.
- Consider restraints if necessary for patient’s and/or personnel’s protection per the Behavioral Emergency Protocol.

---

**First Aid:**
- Glucose <60 with signs of hypoglycemia
  - See Pediatric AMS/Diabetic Emergency Protocol
- Calcium channel blocker: Hypotension and bradycardia
- Tricyclic antidepressant: Hypotension, tachycardia, and QRS width >0.12
- Organophosphate poisoning: Hypotension and tachycardia; S.L.U.D.G.E
- Beta blocker: Hypotension and bradycardia
- Calcium Gluconate (Kalcinate) 50-100 mg/kg slow IV
- Glucagon (GlucaGen) 2 mg IV
- Sodium Bicarbonate 1 mEq/kg IV
- Atropine 0.05-0.1 mg/kg IV; may repeat every 10 min; max 6 mg
- Naloxone (Narcan) 0.1 mg/kg IV/IM; max 2 mg if patient experiencing respiratory depression
- 12-Lead EKG
- Obtain BGL
- Initiate IV
- Notify receiving facility or contact Medical Control

---

**9.11**

Current as of October 2018 Dr. Martin Lutz, Medical Director – Greenville County EMS
History:
- Reported/witnessed seizure activity
- Previous seizure history
- Seizure medications
- History of recent head trauma
- Fever
- Congenital abnormality
- Consider pregnancy in teenage females

Significant Findings:
- Decreased mental status
- Sleepiness
- Observed seizure activity
- Hot, dry skin/hyperthermia

Differential:
- CNS (head) trauma
- Tumor
- Hypoxia/respiratory failure
- Drugs/medications
- Fever
- Infection
- Metabolic abnormality/acidosis

**PEARLS:**
- Pediatric = 1 day to less than age 12, or less than 55 kg in ages 13-18.
- Use Broselow tape for drug dosages.
- Addressing the ABC's and verifying blood glucose is more important than stopping the seizure.
- Avoiding hypoxemia is extremely important.
- Remember to look for evidence of trauma and treat accordingly.
- *Status epilepticus* is defined as two or more successive seizures without a period of consciousness or recovery. This is a true emergency requiring rapid airway control, treatment, and transport.
- **Grand mal seizures (generalized)** are associated with loss of consciousness, incontinence, and tongue trauma.
- **Focal seizures (petit mal)** effect only a part of the body and do not usually result in a loss of consciousness.
- **Jacksonian seizures** are seizures which start as a focal seizure and become generalized.
- Be prepared to assist ventilations especially if Midazolam (Versed) is used.
- If evidence or suspicion of trauma, spine should be immobilized.
- In an infant, a seizure may be the only evidence of a closed head injury.
- If family has Diastat on scene, Paramedics may give per medication instructions.
**Bites and Envenomation**

**History:**
- Type of bite/sting
- Bring description or photo with patient for identification
- Time, location, size of bite/sting
- Previous reaction to bite/sting
- Domestic vs. wild
- Tetanus and rabies risk
- Immunocompromised patient

**Significant Findings:**
- Rash/broken skin/wound
- Pain
- Soft tissue swelling
- Redness
- Blood oozing from the bite wound
- Evidence of infection
- Shortness of breath/wheezing
- Allergic reaction/hives/itching
- Hypotension/shock

**Differential:**
- Animal/human bite
- Snake/spider bite
- Insect sting/bite
  - Bee
  - Wasp
  - Ant
  - Tick
- Tetanus and rabies risk
- Immunocompromised patient

**Significant Findings:**
- Rash/broken skin/wound
- Pain
- Soft tissue swelling
- Redness
- Blood oozing from the bite wound
- Evidence of infection
- Shortness of breath/wheezing
- Allergic reaction/hives/itching
- Hypotension/shock

**Differential:**
- Animal/human bite
- Snake/spider bite
- Insect sting/bite
  - Bee
  - Wasp
  - Ant
  - Tick
- Tetanus and rabies risk
- Immunocompromised patient

---

**PEARLS:**
- For pediatrics muscle spasms, call Medical Control prior to Midazolam (Versed) or Lorazepam (Ativan) administration.
- Human bites have higher infection rates than animal bites due to normal mouth bacteria.
- Carnivore bites are much more likely to become infected and all have risk of rabies exposure.
- Cat bites may progress to infection rapidly due to a specific bacteria (Pasteurella multica)da).
- For all animal bites document contact with animal control officer if not transported.
- Poisonous snakes in this area are generally of the pit viper family: rattlesnake, copperhead, and water moccasin.
- **Coral snake** bites are rare: Very little pain but very toxic. "Red on yellow - kill a fellow, red on black - venom lack."
- **Black widow spider** (black spider with red hourglass on belly): Bites tend to be minimally painful, but over a few hours, muscular pain and severe abdominal pain may develop.
- **Brown recluse spider** (brown spider with fiddle shape on back): Bites are minimally painful to painless. Little reaction is noted initially but tissue necrosis at the site of the bite develops over the next few days.
- Envenomation is generally worse with larger snakes and early in spring. If no pain or swelling, envenomation is unlikely (except for coral snakes).
- Evidence of infection: swelling, redness, drainage, fever, red streaks proximal to wound.
- Immunocompromised patients (i.e. diabetes, chemotherapy, transplant patients) are at an increased risk for infection.
Burns: Thermal/Radiation

**History:**
- Exposure to heat/gas/chemical
- Inhalation injury
- Time of injury
- Past medical history
- Medications
- Other trauma
- Loss of consciousness
- Tetanus/immunization status

**Significant Findings:**
- Pain
- Swelling
- Dizziness
- Loss of consciousness
- Hypotension/shock
- Airway compromise/distress
- Singed facial or nasal hair
- Hoarseness/wheezing

**Differential:**
- **Superficial (1st°):** red and painful (don’t include in TBSA)
- **Partial thickness (2nd°):** blisters
- **Full thickness (3rd°):** painless, charred or leathery skin

**significant findings:**
- Pain
- Swelling
- Dizziness
- Loss of consciousness
- Hypotension/shock
- Airway compromise/distress
- Singed facial or nasal hair
- Hoarseness/wheezing

**Differential:**

</tbody>
</table>
Chest and Abdominal Trauma

History:
- Time of injury
- Type of injury
- Mechanism (blunt vs. penetrating)
- Open vs. closed wound/fracture
- Wound contamination
- Medical history
- Medications
- Tetanus history
- Evidence for multi-trauma
- Loss of consciousness

Significant Findings:
- Pain
- Swelling/bleeding
- Respiratory distress/failure
- Altered sensation/motor function distal the injury
- Diminished pulse/capillary refill distal the injury
- Major traumatic mechanism of injury
- Seat belt markings
- Abdominal distention

Differential:
- Hollow/solid organ trauma
- Grey Turner’s sign (bruising at flanks)
- Cullen’s sign (bruising around navel)
- Referred pain (caused from the brain’s inability to localize area of irritation)
- Parietal pain (caused by irritation to the parietal peritoneal wall)
- Visceral pain (caused from acute stretching of the structure’s wall)

PEARLS:
- Solid abdominal organs: lungs, liver, spleen, kidneys, pancreas. Presents with constant pain. May be referred.
- Hollow organs: heart, stomach, intestines, bladder, gall bladder, uterus, diaphragm, appendix. Presents with visceral, parietal or referred pain. Pain presents as intermittent ache or cramp or sharp, pinpoint pain.
- Notify Greenville Memorial as soon as possible with BP (or hemodynamic stability), airway status (patent, unstable or secured), MOI, GCS and ETA.

Level 1 Trauma:
- RTS less than 10 or GCS greater than 13
- Systolic blood pressure less than 90 or age appropriate tachycardia with poor perfusion
- Heart rate: 0-3 months greater than 150, 3-12 months greater than 120, 1-10 years greater than 130, 10+ years greater than 100
- Respiratory rate less than 10 or greater than 29, or intubated, or decompressed
- Penetrating trauma proximal to the elbow or knee
- Flail chest, shotgun wounds, combination of burns & trauma (2nd⁰ or 3rd⁰), pelvic fracture, limb paralysis, amputation or crush injury proximal to wrist or ankle, life threatening bleeding

Level 2 Trauma:
- Ejection from automobile, death of a passenger in the same vehicle, extrication time greater than 20 minutes, falls greater than 15 feet, vehicle rollover, high-speed crash (collision speed greater or equal to 35 mph with impact to another vehicle or stationary object)
- Auto-pedestrian/auto-bicycle injury with significant impact (greater than or equal to 5 mph) or pedestrian is thrown or rolled over by vehicle
- Motorcycle crash greater than 20 mph or with separation of rider from bike
- Open fractures, excluding hand or feet
- Significant neurological deficit

Notify receiving facility or contact Medical Control

Penetrating

Blunt

Oxygen

Limit scene time to 10 min

Initiate IV

Consider Spinal Immobilization only if neurological deficit

Just enough Normal Saline or Lactated Ringers IV to maintain a radial pulse (MAP of 60)

Consider pleural decompression

Vented chest seals if indicated

Current as of October 2018 Dr. Martin Lutz, Medical Director – Greenville County EMS
Crush Injuries

History:
- Previous medical history
- Medications
- Drugs
- Entrapment/crushing >1 hour

6 P's
- Pain
- Paller/Paleness
- Pulselessness
- Paralysis
- Paresthesia (tingling or burning sensation on skin)
- Poikilothermia (cool to touch)

Significant Findings:
- Entrapment/crushing of one or more large muscle extremity
- Entrapment/crushing of pelvis
- Absent pulse in extremity
- Delayed capillary refill
- Blanched skin in affected extremity
- Diminished sensation
- Extremity cold to touch

Differential:
- Rhabdomyolysis
- Drug overdose
- Compartment syndrome
- Hyperthermia
- Spinal trauma

PEARLS:
- Fluid administration should be conducted prior to patient extrication.
- Treatment may be compromised by confined space or MCI situation. Ideally, start treatment prior to release of compression.
- Patients may become hypothermic even in warm environments.
- Other injuries can cause compartment syndrome such as circumferential burns, pulmonary embolus, thrombosis, severe edema, etc.

Oxygen
12-Lead EKG
Initiate IV
Normal Saline up to 1,000 mL IV

Signs of hyperkalemia (peaked T waves and QRS >0.12)

Calcium Gluconate 10-20 mL IV
followed by Normal Saline 100 mL IV and Sodium Bicarbonate 1 mEq/kg IV

If IV unavailable, Albuterol (Ventolin) 5mg via nebulizer

Notify receiving facility or contact Medical Control

See: Pain Management protocol

See: Pain Management protocol
### Drowning & Submersion Injuries

**History:**
- Submersion in water regardless of depth
- Possible trauma to C-spine
- Possible history of trauma (i.e., diving board)
- Duration of immersion
- Temperature of water or possibility of hypothermia

**Significant Findings:**
- Unresponsive
- Mental status changes
- Decreased/absent vital signs
- Vomiting
- Coughing
- Apnea
- Stridor
- Wheezing
- Rales

**Differential:**
- Trauma
- Pre-existing medical problem
- Pressure injury (i.e., diving)
- Barotrauma
- Decompression sickness
- Post-immersion syndrome
- Hypothermia

**PEARLS:**
- Drownings have a high index of suspicion for possible spinal injuries.
- When water temperature is less than 70°F (21°C) there is no time limit; resuscitate all. These patients have an increased chance of survival.
- Some patients may develop delayed respiratory distress.
- All victims should be transported for evaluation due to potential for worsening over the next several hours.
- Drowning is a leading cause of death among would-be rescuers.
- Allow appropriately trained and certified rescuers to remove victims from areas of danger.
- With pressure injuries (decompression/barotrauma), consider transport to a hyperbaric chamber located at Greenville Memorial.
- Consider hypothermia in all drownings.
- Transport should be strongly advised on all patients who’s head was submerged underwater.
History:
- Type of injury
- Mechanism
  - Crush
  - Penetrating
  - Amputation
- Time of injury
- Open vs. closed wound/fracture
- Wound contamination
- Medical history
- Medications
- Tetanus history

Significant Findings:
- Pain
- Swelling
- Deformity
- Altered sensation/motor function
- Diminished pulse/capillary refill
- Decreased extremity temperature

Differential:
- Abrasion
- Contusion
- Laceration
- Sprain
- Dislocation
- Fracture
- Amputation

PEARLS:
- Peripheral neurovascular status is important.
- In amputations, time is critical. Transport and notify Medical Control immediately so that the appropriate destination can be determined.
- Hip dislocations and knee and elbow fracture/dislocations, have a high incidence of vascular compromise.
- Urgently transport any injury with vascular compromise.
- Blood loss may be concealed or not apparent with extremity injuries.
- Lacerations must be evaluated for repair within 6 hours from the time of injury.
- Splint injured extremities in the position found unless the extremity is pulseless or manipulation is required for extrication.
- Femur fractures should be managed with a traction splint unless hip fracture or shock is present and emergent transport is required.
- Direct pressure and elevation are inadequate in controlling severe bleeding. Utilize a tourniquet if direct pressure to the wound fails to control extremity hemorrhage.
- For uncontrolled hemorrhage in shoulder and groin notify SWAT for hemostatic agent use. Apply direct pressure and DON'T LET GO!

Oxygen
Initiated IV; treat for signs of poor perfusion

Asess for pulse, sensory, and motor function

Associated Pain

Fracture or dislocation

If extremity is pulseless, attempt gentle manipulation to place in normal anatomic position to restore circulation

Hip fracture/dislocations should be stabilized with the use of a scoop stretcher if full spinal immobilization is not required

Amputation

Clean amputated part
Wrap part in sterile dressing soaked in Normal Saline and place in air tight container (sealed bag)
Place container on ice if available

Hemorrhage

Apply direct pressure and elevate

Bleeding controlled?

Yes

No

Apply CAT® tourniquet
Consider hemostatic agent if unable to apply CAT® due to location of injury

Notify receiving facility or contact Medical Control
Eye Injuries / Complaints

### History:
- Time of injury/onset
- Blunt/penetrating/chemical
- Open vs. closed injury
- Wound contamination
- Medical history
- Medications
- Tetanus history
- Involved chemicals
- Material safety data sheet (MSDS)
- Normal visual acuity

### Significant Findings:
- Pain
- Swelling/bleeding
- Deformity/contusion
- Visual deficit
- Leaking aqueous/vitreous humor
- Upwardly fixed eye
- "Shooting" or "streaking" light
- Visible contaminants
- Rust ring
- Lacrimation

### Differential:
- Abrasion/laceration
- Globe rupture
- Retinal nerve damage/detachment
- Chemical/thermal burn/agent of terror
- Orbital fracture
- Orbital compartment syndrome
- Neurological event
- Acute glaucoma
- Retinal artery occlusion

---

**Oxygen**
- F
- I
- Initiate IV

---

**Pain/Visual disturbance**

---

**Injury isolated to eye(s)**
- No
  - See appropriate protocol

---

**Out of socket**

---

**In socket**

---

**Trauma**

---

**Burn/Chemical**

---

**Immediate irrigation with available Normal Saline or water**

---

**Tetracaine 2 gtt (when available)**

---

**Irrigate with Normal Saline using Morgan Lens®**

---

**Cover unaffected eye**

---

** Associated pain**

---

---

**Notify receiving facility or contact Medical Control**

---

**PEARLS:**
- Normal visual acuity can be present even with severe eye injury.
- Remove contact lens whenever possible.
- Any chemical or thermal burn to the face/eyes should raise suspicion of respiratory insult.
- Orbital fractures raise concern of globe or nerve injury and need repeated assessments of visual status.
- Always cover both eyes to prevent further injury.
- Use shields, not pads, for physical trauma to eyes. Pads are okay for unaffected eye.
- Do not remove impaled objects.
- Suspected globe rupture or compartment syndromes require emergent in-facility intervention.
- Patient should be placed in fowlers position with any suspected globe injury.
Head/Face Trauma

**History:**
- Time of injury
- Mechanism (blunt vs. penetrating)
- Loss of consciousness
- Bleeding
- Past medical history
- Medications
- Evidence for multi-trauma

**Significant Findings:**
- Pain
- Swelling/bleeding
- Altered mental status
- Unconscious
- Respiratory distress/failure
- Vomiting
- Major traumatic mechanism of injury
- Seizure

**Differential:**
- Skull fracture
- Brain injury
  - Concussion
  - Contusion
  - Hemorrhage
  - Laceration
- Epidural/subdural hematoma
- Subarachnoid hemorrhage
- Spinal injury

**Significant Findings:**

- Le Fort I
  - Slight swelling
  - Maxilla moves independently of the rest of the face
  - Possible malocclusion

- Le Fort II
  - Massive edema, malocclusion
  - Nose is obviously fractured
  - Cerebrospinal fluid leak possible

- Le Fort III
  - Massive edema
  - Mobility of zygoma, orbital rim
  - Anesthesia of cheek possible
  - Diplopia (without blowout fx of orbit
  - Depression of cheek bone
  - Open bite
  - Cerebrospinal leak possible

**Pearls:**
- If GCS is less than 12 consider air/rapid transport.
- In the absence of capnography, hyperventilate the patient (adult: 20 breaths/min, child: 30 breaths/min, infant: 35 breaths/min) only if ongoing evidence of brain herniation (blown pupil, decorticate or decerebrate posturing, or bradycardia).
- Increased intracranial pressure (ICP) may cause hypertension and bradycardia (Cushing's Response).
- Hypotension usually indicates injury or shock unrelated to the head injury and should be aggressively treated.
- The most important item to monitor and document is a change in the level of consciousness.
- Consider restraints if necessary for patient’s and/or personnel’s protection per the Behavioral Emergencies/Chemical Restraint Protocol.
- Limit IV fluids unless patient is hypotensive.
- Concussions are periods of confusion or LOC associated with trauma which may have resolved by the time EMS arrives. Any prolonged confusion or mental status abnormality which does not return to normal within 15 minutes or any documented loss of consciousness should be evaluated by a physician as soon as possible.
- In areas with short transport times, RSI/drug-assisted intubation is not recommended for patients who are spontaneously breathing and who have oxygen saturations greater than 90% with supplemental oxygen.

**Decision Tree:**

1. Oxygen; maintain O2 sat >90% and EtCO2 between 35 and 45
2. Consider Spinal Immobilization
3. Obtain BGL
4. Obtain 12-Lead EKG
5. Initiate IV
6. Glucose <60 with signs of hypoglycemia
7. Yes → 10% Dextrose (D10) 250 mL IV
8. No → Consider intubation
9. GCS < 8
   - Yes → Consider intubation
   - No → Notify receiving facility or contact Medical Control

Current as of October 2018 Dr. Martin Lutz, Medical Director – Greenville County EMS
Heat Related Injuries

History:
- Age
- Exposure to increased temperatures and/or humidity
- Past medical history/medications
- Extreme exertion
- Time and length of exposure
- Poor oral intake
- Fatigue and/or muscle cramping
- Alcohol/illicit drug use

Significant Findings:
- Altered mental status
- Unconsciousness
- Hot, dry or sweaty skin
- Hypotension/shock
- Seizures
- Nausea

Differential:
- Fever (infection)
- Dehydration
- Medications/drugs
- Hyperthyroidism (storm)
- Delirium tremens (DT’s)
- Heat cramps
- Heat exhaustion
- Heat stroke
- CNS lesions/tumors

PEARLS:
- Extremes of age are more prone to heat emergencies (i.e., young and old).
- Predisposed by use of: tricyclic antidepressants, phenothiazines, anticholinergic medications, and alcohol.
- Cocaine, amphetamines, and salicylates may elevate body temperatures.
- Sweating generally disappears as body temperature rises above 104°F (40°C).
- Intense shivering may occur as patient is cooled.
- **Heat cramps** consists of benign muscle cramping and is not associated with an elevated temperature.
- **Heat exhaustion** consists of dehydration, salt depletion, dizziness, fever, mental status changes, headache, cramping, nausea and vomiting. Vital signs usually consist of tachycardia, hypotension, and an elevated temperature.
- **Heat stroke** consists of dehydration, tachycardia, hypotension, temperature greater than 104°F (40°C), and an altered mental status.
Hypovolemic Shock

**History:**
- Past medical history
- Medications
- Estimated downtime

**Significant Findings:**
- Restlessness/confusion
- Weakness/dizziness
- Weak, rapid pulse
- Pale, cool, clammy skin
- Delayed capillary refill
- Altered mental status

**Differential:**
- Shock
  - Hypovolemic
  - Cardiogenic
  - Septic
  - Neurogenic
  - Anaphylactic
- Ectopic pregnancy
- Dysrhythmias
- Pulmonary embolus
- Tension pneumothorax
- Medication effect/overdose
- Vasovagal
- Physiologic (pregnancy)

**RAPID TRANSPORT**

<table>

</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Consider Spinal Immobilization</td>
</tr>
<tr>
<td>I</td>
<td>Activate Trauma alert</td>
</tr>
<tr>
<td>I</td>
<td>Initiate IV/IO; place 2nd IV/IO when feasible</td>
</tr>
</tbody>
</table>

**Pearls:**
- Notify trauma center of the START triage category as soon as possible. When en-route notify trauma center of GCS, major area of injury or mechanism of hypovolemia, and anticipated ETA.
Selective Spinal Immobilization

- **Pearls:**
  - Full spinal immobilization to include the use of a long spine board should be used judiciously and according to current evidence-based practices. Limiting spinal movement may be best achieved in alert patients by application of a rigid cervical collar, securing the patient firmly to a stretcher, and using verbal coaching to limit neck/back movement.
  - Ambulatory patients that require spinal immobilization can have an appropriately sized cervical collar placed and pivot/sit to the stretcher for securing.
  - Non-ambulatory and alert patients can be lifted using a scoop stretcher and a C-collar in lieu of a backboard. The scoop can be removed during transport if causing pain or distress.
  - In situations where the patient is still in a vehicle, consider allowing alert and oriented patients to wear a C-collar and extricate themselves to the stretcher.
  - Non-alert patients require full traditional immobilization utilizing either a backboard or scoop.
  - Range of motion should **NOT** be assessed if patient has midline spinal tenderness. Patient's range of motion should not be assisted. The patient should touch their chin to their chest, extend their neck (look up), and turn their head from side to side (shoulder to shoulder) without spinal process pain. The acronym "NSAIDS" should be used to remember the steps in this protocol:
    - Neurologic exam: Look for paralysis, focal deficits such as tingling, reduced strength, numbness in an extremity, loss of urethral or sphincter control (incontinence), or priapism.
    - Significant mechanism of injury includes high energy events such as ejection, high falls, and abrupt deceleration crashes, blunt trauma to the neck, or extremes of age.
    - Alertness: Is patient oriented to person, place, time, and situation? Any change to alertness with this incident? Normal GCS?
    - Intoxication: Is there any indication that the person is intoxicated (impaired decision making ability)?
    - Distracting injury: A condition thought by the clinician to be producing pain sufficient to distract the patient from a secondary (neck) injury.
    - Spinal exam: Look for point tenderness in any spinal process or spinal process tenderness with range of motion.
  - If experiencing difficulty fitting the C-collar to the patient consider other options such as a towel roll.

---

**Diagram:**

- Neuro Exam: any focal deficit
  - Yes
  - No
- Significant mechanism meeting criteria for trauma activation
  - Yes
  - No
- Alertness: any alteration in patient's normal
  - Yes
  - No
- Intoxications: Any evidence
  - Yes
  - No
- Distracting injury (see Pearls)
  - Yes
  - No
- Spinal exam: point of tenderness over the spinal process or pain during ROM
  - Yes
  - No
- Spinal immobilization not indicated
  - Yes
  - No
- Selective spinal immobilization required (see Pearls)
  - Yes
  - No

During initial assessment, care should be used at all times to limit movement of the spine and neck in patients with potential injuries.

Patients with penetrating trauma to the head, neck, or torso and no evidence of spinal injury should not be immobilized on a backboard.
Traumatic Cardiac Arrest (Adult)

**History:**
- Past medical history
- Medications
- End stage renal disease
- Estimated downtime
- Suspected hypothermia
- Suspected overdose
- DNR form

**Significant Findings:**
- Unresponsive
- Pulseless
- Apneic
- No electrical activity on EKG
- V-fib/V-tach
- No auscultated heart tones

**Withhold resuscitation:**
- No pulse and asystole
- PEA < 30 BPM
- Injuries incompatible with life

Consider terminating resuscitation if at any time patient presents with asystole or wide complex PEA < 30 BPM.

**PEARLS:**
- Hangings are not considered trauma. See appropriate medical protocol.
- Always confirm asystole in more than one lead.
- Assign a team resuscitation leader and utilize checklist.
- Place monitor in paddles mode with metronome on.
- Reassess and document endotracheal tube placement and EtCO\textsubscript{2} frequently, after every move, and at transfer of care.
Traumatic Cardiac Arrest (Pediatric)

History:
- Past medical history
- Medications
- End stage renal disease
- Estimated downtime
- Suspected hypothermia
- Suspected overdose
- DNR form

Significant Findings:
- Unresponsive
- Pulseless
- Apneic
- No electrical activity on EKG
- V-fib/V-tach
- No auscultated heart tones

PEARLS:
- Hangings are not considered trauma. See appropriate medical protocol.
- Always confirm asystole in more than one lead.
- Assign a team resuscitation leader and utilize checklist.
- Place monitor in paddles mode with metronome on.
- Reassess and document endotracheal tube placement and EtCO₂ frequently, after every move, and at transfer of care.

Consider withholding resuscitation if:
- No pulse and asystole
- Injuries incompatible with life

Criteria for Death/DNR

Rapid Transport

- Immediate continuous compressions
- Cardiac monitor/AED
- Initiate IV/IO
- Place advanced airway and provide 8-10 breaths per minute
- Treat correctable causes early
- Attach resQpod
- Perform bi-lateral pleural decompressions if penetrating or blunt force chest trauma

PEA > 30

Return of spontaneous circulation

Notify receiving facility or contact Medical Control
**WMD-Nerve Agent**

**History:**
- Exposure to chemical/biologic/radiologic/nuclear hazard
- Potential exposure to unknown substance/hazard

**Significant Findings:**
- Visual disturbances
- Headache
- Nausea/vomiting
- Salivation
- Lacrimation
- Respiratory distress
- Diaphoresis
- Seizure activity
- Respiratory arrest
- Fascication

**Differential:**
- Nerve agent exposure (e.g., VX, sarin, soman, etc.)
- Organophosphate exposure (pesticide)
- Vesicant exposure (e.g., mustard gas, etc.)
- Respiratory irritant exposure (e.g., hydrogen sulfide, ammonia, chlorine, etc.)

---

**Minor Symptoms:**
- Salivation
- Lacrimation
- Visual disturbances

**Pearls:**
- In the face of a bona fide attack, begin with 1 nerve agent kit for patients less than 7 years of age, 2 nerve agent kits from 8 to 14 years of age, and 3 nerve agent kits for patients 15 years of age and over.
- If triage/MCI issues exhaust supply of nerve agent kits, use pediatric atropens (if available). Use the 0.5 mg dose if patient is less than 40 pounds (18 kg), 1 mg dose if patient weighs between 40 to 90 pounds (18 to 40 kg), and 2 mg dose for patients greater than 90 pounds (greater than 40 kg).
- Follow local HAZMAT protocols for decontamination and use of personal protective equipment.
- Carefully evaluate patients to ensure they are not reacting from exposure to another agent (e.g., narcotics, vesicants, etc.).
- All supervisors carry nerve agent kits which contains 600 mg of Pralidoxime (Protopam) and 2 mg of Atropine.

The main symptom that the Atropine addresses is excessive secretions so Atropine should be given until salivation improves.

**Major Symptoms:**
- Altered mental status
- Seizures
- Respiratory distress

---

**Oxygen**
- Initiate triage and/or decontamination as indicated; avoid inhalation and skin contact
- Initiate IV
- 12-Lead EKG
- Obtain BGL

**Atropine**
- 2 mg IV/IM every 5 min until symptoms resolve

**Nerve agent kit**
- IM x3 rapidly (see pediatric doses below)

**If unconscious, seizing and/or fasciculating:**
- Lorazepam (Ativan) 1-2 mg IV/IM (may be repeated once after 5 min) or Midazolam (Versed) 10 mg/2 mL slow IV push
- Atropine 2 mg IV/IM every 5 min until symptoms resolve

**Notify receiving facility or contact Medical Control**

Use JumpSTART if the Patient appears to be a child.
Use an adult system, such as START, if the patient appears to be a young adult.

Triage Categories

- **EXPECTANT** (Black Triage Tag Color)
  - Victim unlikely to survive given severity of injuries, level of available care, or both
  - Palliative care and pain relief should be provided

- **DELAYED** (Yellow Triage Tag Color)
  - Victim’s transport can be delayed
  - Includes serious and potentially life-threatening injuries, but status not expected to deteriorate significantly over several hours

- **IMMEDIATE** (Red Triage Tag Color)
  - Victim can be helped by immediate intervention and transport
  - Requires medical attention within minutes for survival (up to 60)
  - Includes compromises to patient’s Airway, Breathing, Circulation

- **MINOR** (Green Triage Tag Color)
  - Victim with relatively minor injuries
  - Status unlikely to deteriorate over days
  - May be able to assist in own care: “Walking Wounded”
START Triage

        - ≤30:
          - Perfusion
            - Radial pulse absent or capillary refill > 2 sec: IMMEDIATE
            - Radial pulse present or capillary refill ≤ 2 sec:
              - Mental status
                - Doesn’t obey commands: IMMEDIATE
                - Obeys commands: DELAYED

Triage Categories

EXPECTANT
- Black Triage Tag Color
  - Victim unlikely to survive given severity of injuries, level of available care, or both
  - Palliative care and pain relief should be provided

IMMEDIATE
- Red Triage Tag Color
  - Victim can be helped by immediate intervention and transport
  - Requires medical attention within minutes for survival (up to 60)
  - Includes compromises to patient’s Airway, Breathing, Circulation

DELAYED
- Yellow Triage Tag Color
  - Victim’s transport can be delayed
  - Includes serious and potentially life-threatening injuries, but status not expected to deteriorate significantly over several hours

MINOR
- Green Triage Tag Color
  - Victim with relatively minor injuries
  - Status unlikely to deteriorate over days
  - May be able to assist in own care: "Walking Wounded"
STEPS FOR INCIDENT MANAGEMENT:

- **SAFETY Assessment**
  - Identify all hazards; electrical, flammable, CBRNE: chemical, biological, radiological, nuclear, and high-yield explosives.
  - Be aware of the potential for secondary explosive devices.
  - Are patients contaminated and require decontamination?

- **SIZE Up**
  - Survey incident scene. *(Get the big picture)*.
  - Type and/or cause of incident.
  - Approximate number of patients and severity levels.
  - Identify problems accessing scene for incoming resources.

- **SEND information: Provide situation report to communications**
  - Identify EMS Medical Commander (last name)
  - Provide situation report
  - Request a balance of resources.
  - Provide staging instructions
  - Communications shall alert Greenville Hospital System and St. Francis that a mass-care-incident has occurred.
  - Implement departmental personnel accountability system

- **SETUP the scene for management of the casualties**
  - Establish staging area Level 1 for on scene staging or Level 2 staging for “off site” staging of resources and/or personnel.
  - Identify access and egress routes.
  - Identify adequate work areas for Triage, Treatment, Transportation, and LZ.

- **START (Simple Triage and Rapid Treatment) and JumpSTART (for pediatric patients)**
  - Begin where you are.
  - Ask anyone who can walk to move to a designated area.
  - Move quickly from patient to patient.
  - Initially patient’s priority level will be indicated by placing the appropriate color triage tape on victim’s extremity. Maintain patient count by triage color.
  - Provide minimal treatment.
  - Keep moving *(situational awareness)*.

**Definitions:**

- **Major Event** is defined as any incident with fewer than 25 patients
- **Mass Care incident** is defined as any incident with 25 to 100 patients
- **Disaster is defined** as any incident with 100 patients of greater

- Fast Attack Command: A small scale incident which can be managed by a Medical Group Supervisor. One person may assume more than one function (i.e., Triage, treatment, etc.).
- Fixed Command: Larger events (based on size, complexity, or potential for rapid expansion), that require an early stationary command. In these cases, the first arriving Medical Incident Commander will assume medical command and, from the very beginning, stay out of the hazard zone in a stationary unified command position.

PEARLS:

- Never go after the obvious at the expense of the basics.
- Do the greatest good for the greatest number.
- Make the best use of personnel, equipment, and resources.
- Do not relocate the disaster (Right Patient-Right Facility).
- During large scale incidents, alternate care facilities such as Urgent Care, Ambulatory Care, and other out-patient care facilities may be utilized to manage low acuity patients.
- Greenville Memorial Hospital determines patient destination and shall be provided with updated situation report(s) by the on scene Medical Communications Coordinator.
Please refrain from using codes, and non-standard abbreviations (not commonly accepted by the medical community)

Evaluating for the difficult airway (LEMON)

Between 1–3% of patients who require endotracheal intubation have airways that make intubation difficult. Recognizing those patients who may have a difficult airway allows the Paramedic to proceed with caution and to keep as many options open as possible. It also allows the Paramedic to prepare additional equipment (such as the bougie and BIAD) that may not ordinarily be part of a standard airway kit. The mnemonic LEMON is useful in evaluating patients for signs that may be consistent with a difficult airway and should raise the Paramedic’s index of suspicion.

Look Externally: External indicators of either difficult intubation or difficult ventilation include: presence of a beard or moustache, abnormal facial shape, edentulous mouth, facial trauma, obesity, large front teeth or “buck teeth”, high arcing palate, receding mandible, short bull neck.

Evaluate 3-3-2 Rule: 3 fingers between the patient’s teeth (patient’s mouth should open adequately to permit three fingers to be placed between the upper and lower teeth) 3 fingers between the tip of the jaw and the beginning of the neck (under the chin) 2 fingers between the thyroid notch and the floor of the mandible (top of the neck).

Mallampati –

Obstruction: Besides the obvious difficulty if the airway is obstructed with a foreign body, the Paramedic should also consider other obstructers such as tumor, abscess, epiglottis, or expanding hematoma.

Neck Mobility: Ask the patient to place their chin on their chest and to tilt their head backward as far as possible. Obviously, this will not be possible in the immobilized trauma patient.

## Pearls:

- Any acute coronary syndrome patient that presents a high suspicion for need of intervention should be transported to a PCI capable hospital.
- Once the destination hospital has been determined, the EMS crew must call the receiving facility via a recorded line as soon as possible. The report should include Age, Sex, Chief complaint, & Vital signs.
- A more complete report should be given for higher acuity patients.
- Any deviation of this Hospital Destination Guideline should be made by the diverting physician on a recorded line.
- Behavioral patients should be evaluated on a one-by-one basis by the EMS crew and will be transported to the nearest, most appropriate facility.
- Every attempt should be made to transport all OB patients to the hospital in which their OB physician is located.
- The patient retains the right to refuse a diversion. In these cases notify the receiving hospital that the diversion was refused by patient, and have the patient sign a refusal declining the recommendation to divert to a more appropriate facility.

High likelihood of LVO with a score greater than or equal to 5

**R.A.C.E.** is based on an abbreviated version of the NIHSS, the “gold standard” for evaluating stroke victims.

- The maximum score is 9 (not 11) because the evaluation is done on the left or right side not both simultaneously.
- The **R.A.C.E.** is a 5 of 6 item scale. The last item is 1 of 2 based on which side the patient has deficits on previous scale items.
- The NIHSS equivalent is provided for the benefit of receiving facility. The NIHSS score may be higher than the “snap shot” provided in the **R.A.C.E.** because the NIHSS evaluates additional areas not covered in the **R.A.C.E.** which is short by design for EMS field use.
- The **R.A.C.E.** is a universal *quantitative* tool that is needed to determine the *severity* of a stroke and to identify strokes with large vessel occlusions (LVO) which would benefit going to a Comprehensive Stroke Center (CSC). This is similar to a 12-lead EKG identifying a STEMI and being transported to a PCI Cardiac Center for intervention.
- The Cincinnati (CPSS), the F.A.S.T., the Miami (MENDS), the Los Angeles (LAPSS) stroke scales are good scales that offer high degree of sensitivity for strokes, but they are all *qualitative* scores (positive or negative) and not *quantitative* (severity).
- The cut-score of 4 is based on the significant global accuracy of **R.A.C.E.** predicting an LVO and its close correlation to the NIHSS.
- A free online tool is available to calculate a **R.A.C.E.** score at: http://www.rccc.eu/race/RACEen.html
- For the study behind the **R.A.C.E.** see http://stroke.ahajournals.org/content/45/1/87.full
Cincinnati Stroke Scale

A system used to diagnose the presence of a stroke in a patient. It tests 3 signs for abnormal findings which may indicate that the patient is having a stroke. If any one of the 3 tests shows abnormal findings, the patient may be having a stroke and should be transported to a hospital as soon as possible.

**Facial droop:**

Have the person smile or show his or her teeth. If one side doesn’t move as well as the other so it seems to droop, that could be sign of a stroke.

- Normal: Both sides of face move equally
- Abnormal: One side of face does not move as well as the other (or at all)

**Arm drift:**

Have the person close his or her eyes and hold his or her arms straight out in front for about 10 seconds. If one arm does not move, or one arm winds up drifting down more than the other, that could be a sign of a stroke.

- Normal: Both arms move equally or not at all
- Abnormal: One arm does not move, or one arm drifts down compared with the other side

**Speech:**

Have the person say, "You can't teach an old dog new tricks," or some other simple, familiar saying. If the person slurs the words, gets some words wrong, or are unable to speak, that could be sign of stroke.

- Normal: Patient uses correct words with no slurring
- Abnormal: Slurred or inappropriate words or mute

Inferior MI

ST elevation 2, 3, AVF

Septal MI

ST elevation V1 & V2

Anterior MI

ST elevation V3 & V4
Lateral MI

ST elevation V5 & V6, I & aVL

Inferior MI with Right Ventricular Involvement

Key ID Points
- ST elevation in III > II
- Reciprocal ST depression pattern in V1, V2, V3
- ST elevation on right sided RV leads on 15 lead EKG
### Right Bundle Branch Block

#### Key ID Points
- QRS looks wide with duration >120
- From J point read V1, right to left
- If 1st deflection from J point is up = RBBB
- Look at QRS Axis for LAD or RAD
- Left Axis Deviation (LAD) >30 = Anterior hemiblock
- Right Axis Deviation (RAD) >90 = Posterior hemiblock
- LAD or RAD + RBBB = Bifascicular block
- RBBB may be a STEMI

### Left Bundle Branch Block

#### Key ID Points
- QRS looks wide with duration >120
- From J point read V1, right to left
- If 1st deflection from J point is down = LBBB
- LBBB is not a STEMI
Left Ventricular Hypertrophy

Voltage Based Criteria
- Lead I: R wave >14
- Lead aVR: S wave >15
- Lead aVL: R wave >12
- Lead aVF: R wave >21
- Lead V5: R wave >26
- Lead V6: R wave >20

Early Repol
- Depressed and lengthened PR interval
- Concave ST segment elevation
- Global or not following strain pattern
- May or may not experience pain

Pericarditis
- Depressed and lengthened PR interval
- Concave ST segment elevation
- Global or not following strain pattern
- PAIN IS DIFFERENT
  - Pain decreases upon leaning forward
  - Worsen upon drinking
Acetaminophen (Tylenol, Feverall, Panadol)

- 0.02mg/kg (0.2 mL/kg) IV; minimum of 0.1 mg  
- Maximum single dose 0.5 mg child; 1 mg adolescent  
- May repeat once  
**Organophosphate Poisoning:**  
- To block parasympathetic response:  
  - Children 0.05 to 0.1 mg/kg loading dose;  
  - Adolescents 2mg loading dose  
- Repeat every 10-15 minutes until rales and bronchial secretions resolves |
| **GCEMS Protocol:** | Multiple  
**Indications:**  
- Anticholinergic drug used in bradycardias  
- Organophosphate poisoning  
- Pediatric: Symptomatic bradycardia secondary to AV block or vagal activity; 2nd line after Epinephrine for bradycardia due to poor perfusion of hypotension  
**Contraindications:**  
- Tachycardia  
- A-fib/A-flutter with rapid ventricular rate  
**Side Effects:**  
Tachycardia, dry mouth, thirst, flushing of skin, blurred vision, headache, pupillary dilation, urine retention |  |
### Calcium Gluconate
*(Kalcinate)*

**GCEMS Protocol:**
- Poisoning/OD
- Ped poisoning/OD

**Indications:**
- Calcium channel blocker overdose
- Magnesium Sulfate drip toxicity
- Certain types of arrest
- Known hypocalcemia or hypokalemia

**Contraindications:**
- Use with extreme caution in patients taking digitalis

**Side Effects:**
- Hypotension, bradycardia, arrhythmia, cardiac arrest, chalky or metallic taste, feeling that a “wave of heat” is passing through the body.

### Combivent
*(DuoNeb)*

**GCEMS Protocol:**
- Reactive Airway Disease
- Drowning

**Indications:**
- Bronchospasm
- COPD

**Contraindications:**
- Hypersensitivity to Atrovent, Atropine or its derivatives
- Hypersensitivity to Albuterol, soybean, or peanuts

**Side Effects:**
- Tachycardia, palpitations, eye pain, urinary retention, UTI, uticardia, bronchitis

(D10)         | - 250 mL IV; may repeat once if still unresponsive and low BGL         | - 2-4 mL IV; may repeat once if still unresponsive and low BGL             |
| **GCEMS Protocol:** | Multiple                                                                |                                                                           |
| **Indications:** | • Suspected hypoglycemia  
• Altered LOC  
• Coma/seizure of unknown etiology |                                                                           |
| **Contraindications:** | • Intracranial hemorrhage  
• Known CVA |                                                                           |
| **Side Effects:** | Local irritation, may precipitate severe neurologic symptoms in alcoholics |                                                                           |
| **GCEMS Protocol:** | Multiple                                                                |                                                                           |
| **Indications:** | • Suspected hypoglycemia  
• Altered LOC  
• Coma/seizure of unknown etiology |                                                                           |
| **Contraindications:** | • Intracranial hemorrhage  
• Known CVA |                                                                           |
| **Side Effects:** | Local irritation, may precipitate severe neurologic symptoms in alcoholics, causes local tissue necrosis if IV infiltrates |                                                                           |
| **Diazepam**  
(Valium)       | - 1-5 mg IV/IO/IM to a maximum of 10 mg                                  | - 0.2 mg/kg IV/IO/IM titrated to a single max dose of 5 mg; may be repeated once every five minutes to a total maximum dose of 10 mg |
| **GCEMS Protocol:** | Alternative to Lorazepam in cases of drug shortage                     |                                                                           |
| **Indications:** | • Major motor seizures  
• Status epilepticus  
• Premedication prior to cardioversion, transcutaneous pacing  
• Skeletal muscle relaxant  
• Acute anxiety states  
• Medication for combative patients and difficult intubations |                                                                           |
| **Contraindications:** | • Respiratory depression |                                                                           |
| **Side Effects:** | Respiratory/cardiac arrest, decreased LOC, hypotension     |                                                                           |
**Drugs**

**Diltiazem**
*(Cardizem)*

**GCEMS Protocol:**
Narrow Complex Tachycardia

**Indications:**
- Rate control in refractory atrial fibrillation and SVT

**Contraindications:**
- Concurrent or recent use of beta blockers

**Side Effects:**
Hypotension, heart block

- 20 mg IV/IO over 2 minutes if systolic BP >90 mmHg
- If uncontrolled after 15 minutes from initial dose, administer 25 mg IV/IO over 2 minutes if systolic BP >90 mmHg

**Not approved**

**Diphenhydramine**
*(Benadryl)*

**GCEMS Protocol:**
Anaphylactic / Allergic Reaction
Ped. Anaphylactic / Allergic Reaction

**Indications:**
- Anaphylaxis
- Allergic reaction
- Urticaria
- Extra pyramidal reaction

**Contraindications:**
- Asthma
- COPD
- Pregnancy
- Nursing mothers
- Acute glaucoma

**Side Effects:**
Sedation, dries bronchial secretions, blurred vision, headache, palpitations

- 50 mg IV/IM
- 1 mg/kg IV/IM; maximum of 30 mg

**Dopamine**
*(Intropin)*

**GCEMS Protocol:**
Multiple

**Indications:**
- Cardiogenic shock associated with hypotension

**Contraindications:**
- Hypovolemic shock where complete fluid resuscitation has not occurred
- Uncorrected tachydysrhythmias or V-fib

**Side Effects:**
Tachydysrhythmias, ectopy, headache, angina, nausea/vomiting

- 5-20 mcg/kg/min IV/IO
- 2-5 mcg/kg/min IV/IO initially, up to 20 mcg/kg/min titrated to B/P

**DIRECT MEDICAL ORDER REQUIRED**

| **Epinephrine** (Adrenalin) | Cardiac Arrest:  
1 mg 1:10,000 solution IV/IO every 3-5 minutes until ROSC  
Anaphylactic Shock / Allergic Reaction:  
If patient has respiratory distress and other signs of an allergic reaction 0.5 mg 1:1000 solution IM; may repeated every 15 minutes up to three times for a total of 4 doses.  
Contact Medical Control if patient is hemodynamically unstable, for orders of 1:10,000 solution 0.5 mg IV  
Hypotension  
10-20 mcg (1-2 ml) 1:100,000 q10-15m | Cardiac Arrest:  
0.01 mg/kg (0.1 mL/kg) 1:10,000 solution IV/IO every 3-5 minutes until ROSC  
Bradycardia:  
0.01 mg/kg (0.1 mL/kg) 1:10,000 solution IV/IO every 3-5 minutes until rhythm changes or physician directs otherwise  
Anaphylactic Shock / Allergic Reaction:  
If patient is under 3 years of age contact Medical Control and request an order of 0.01 mg/kg 1:1,000 solution up to a max of 0.5 mg IM  
If patient has respiratory distress and other signs of an allergic reaction; may be repeated up to three times every 15 minutes or a total of 4 doses  
Contact Medical Control if patient is hemodynamically unstable, for orders of 1:10,000 solution 0.3 mg IV  |
| **Etomidate** (Amidate) | Cardiac Arrest:  
0.3 mg/kg slow IV push over 30 seconds | Cardiac Arrest:  
0.3 mg/kg slow IV push over 30 seconds  
No approved |
| **Furosemide** (Lasix) | Cardiac Arrest:  
IV/IO/IM dose equal to twice the patient’s normal daily dose to a maximum of 80 mg  
If daily dose unknown, administer 40 mg IV/IO/IM  
If patient is not on Lasix, contact Medical Control  
Withhold if patient’s systolic BP is less than 90 | Cardiac Arrest:  
Up to 2 mg/kg IV/IO/IM slow administration  
**Direct Medical Control Oder**  |
|  | **Contraindications:**  
There are no contraindications to the use of Epinephrine in the situation of cardiac arrest  
**Side Effects:**  
Palpitations, hypertension, dysrhythmias, anxiety, tremors |  |
|  | **Indications:**  
- V-fib / Pulseless V-tac  
- Asystole  
- Pulseless electrical activity (PEA)  
- Anaphylaxis  
- Brochospasm |  |
|  | **Indications:**  
- For use in RSI protocol for anesthesia induction  
**Contraindications:**  
- Known sensitivity to the drug |  |
|  | **Indications:**  
- Pulmonary edema  
- CHF |  |
|  | **Contraindications:**  
- Pregnancy  
- Dehydration  
- Hypovolemic States  
- Hypokalemia  
**Side Effects:**  
Dehydration, dysrhythmias, nausea/vomiting |  |
|  |  |  |

### Glucagon (GlucaGen)

**GCEMS Protocol:**
- Multiple

**Indications:**
- Hypoglycemia
- Beta blocker overdose

**Contraindications:**
- Hypersensitivity
- Insulinoma
- Pheochromocytoma

**Side Effects:**
Relatively free of adverse reactions except for occasional nausea/vomits, urticaria, respiratory distress, and hypotension have been reported

**Altered Mental Status/Diabetic Emergencies, Seizures:**
- 1 mg IM/SQ

**Beta Blocker Overdose:**
- 2 mg IV/IO/IM

**Pediatric:**
- 0.1 mg/kg IM; maximum 1 mg

---

### Heparin Sodium Injection

**GCEMS Protocol:**
- Acute Coronary Syndrome
- Post Resuscitation

**Indications:**
- Anticoagulation therapy

**Contraindications:**
- Severe thrombocytopenia
- Uncontrollable active bleeding

**Side Effects:**
No immediate side effects except hypersensitivity reaction. Late side effects include minor or major hemorrhage, including intracerebral hemorrhage

**STEMI:**
- 5000 units IV/IO

**Pediatric:**
- Not approved

---

### Ketamine (Ketalar)

**GCEMS Protocol:**
- Multiple-OLMC ONLY

**Indications:**
- Procedural sedation
- Chemical restraint
- Pre-intubation induction agent
- Post intubation sedation

**Contraindications:**
- Increased intraocular pressure
- Age < 12
- SBP > 210 or > 110 Diastolic

**Side Effects:**
Tachycardia, Increased BP, Hallucinations, delirium, involuntary quivering, nightmares

**Procedural Sedation**
- 1 mg/kg IV
- **Rapid Sequence Induction / Sedation post Airway**
- 2 mg/kg IV; Sedation may be repeated in 15 minutes
- **Chemical Restraint**
- 4 mg/kg IM; age < 65 years old

**Pediatric:**
- Not approved

| **Oxytocin**  
(Pitocin) | | Not Approved |
| **GCEMS Protocol:** | Obstetrical Emergencies | |
| **Indications:** | • Post Partum Hemorrhage | • 20 units in 1000 mL or Normal Saline/Lactated Ringers; slow IV infusion titrated according to severity of bleeding and uterine response; in postpartum females only |
| **Contraindications:** | • Presence of a second fetus  
• Previous cesarean Section | • Given only after baby and placenta are delivered  
• Overdose can cause uterine rupture  
• Vital signs and uterine tone should be monitored constantly  
• Do not give to patients taking vasopressors |
| **Side Effects:** | Uterine rupture, anaphylaxis, dysrhythmias, nausea/vomiting, hypertension | |

| **Piperacillin/Tazobactam**  
(Zosyn) | | Not Approved |
| **GCEMS Protocol:** | Sepsis | |
| **Indications:** | • SIRS criteria x2 and known or suspected source of infections other than pulmonary | • 3.375 G (or 4.5 G) mixed in 50 mL of NS infused IV/IO over 20 minutes |
| **Contraindications:** | • Allergy to Zosyn, penicillin or their derivatives | |
| **Side Effects:** | None in the prehospital setting | |

| **Pralidoxime**  
(Protopam) | | |
| **GCEMS Protocol:** | WMD – Nerve Agents | |
| **Indications:** | • Treatment of muscle weakness and/or respiratory depression secondary to poisoning due to nerve agents | • 1,000-2,000 mg; followed by 25 mg every 5 minutes as needed |
| **Contraindications:** | • Known Hypersensitivity | • 20-50 mg/kg; maximum 2,000 mg |
| **Side Effects:** | Dizziness, headache, drowsiness, nausea, tachycardia, increased blood pressure, hyperventilation, muscular weakness | |
### Racemic Epinephrine (MicroNEFIN, Vaponephrine)

**GCEMS Protocol:**
Pediatric Reactive Airway Disease

**Indications:**
- Croup (Laryngotracheobronchitis)

**Contraindications:**
- Should not be used in management of epiglottitis

**Side Effects:**
Can result in tachycardia and possible arrhythmias

**Not Approved**

- 0.5 mL (diluted to 3 mL with Normal Saline) nebulized; may not repeat.
- Physician in the receiving ED should be notified that treatment has been administered.

### Sodium Bicarbonate (NaHCO3)

**GCEMS Protocol:**
Multiple

**Indications:**
- Severe Metabolic acidosis
- Cardiac arrest (after ventilation problems are corrected)
- Certain medication overdoses
- Hyperkalemia

**Contraindications:**
- CHF
- Hypokalemia

**Side Effects:**
Metabolic alkalosis, increased vascular volume, pulmonary edema, dysrythmias through serum potassium depletion, transiently raises the arterial PCO2

- 1 mEq/kg IV/IO; may repeat 0.5 mEq/kg every 10 minutes.
- 1 mEq/kg IV/IO
- Age <2 years: Must be diluted 1:1 with D5W or Normal Saline prior to administration.

### Sodium Chloride 0.9% (Normal Saline)

**GCEMS Protocol:**
Multiple

**Indications:**
- Need for fluid resuscitation
- Used as delivery agent for infusions

**Contraindications:**
- Congestive heart failure

**Side Effects:**
Volume overload, congestive heart failure, diuresis, thirst

- IV/IO dependent upon patient condition and situation being treated
- IV/IO dependent upon patient condition and situation being treated
